

STANDARD FIVE MATHEMATICS REVIEW BOOKLET

(Revised April 2018)

Curriculum Planning and Development Division

NOTES TO TEACHERS AND STUDENTS

- The booklet highlights some important facts and processes that students are required to know in Mathematics through their preparation for the SEA, as prior knowledge for Form One.
- The booklet can be used as a resource for revision by students as they transition from Upper Primary to Form One.
- This booklet is not designed to replace the initial teaching of concepts, procedures and problem solving if reinforcement of these skills is needed by students.
- Examples/illustrations and explanations are provided to support the understanding of the underlying concepts and demonstrate the skills and processes required for problem solving at this level.

Produced by: Patrick Ramdath, Curriculum Officer – Mathematics

Revised by: Jacqueline Pariag, Curriculum Officer – Mathematics

D. STATISTICS	80
Mathematics Facts	86

A. NUMBER - Whole Numbers																																																																																																					
Facts to Remember	Illustration/ Example																																																																																																				
A factor is a number that divides another number, leaving no remainder. The number 1 is a factor of every number. Every number is a factor of itself. The largest factor of ANY number is the number itself.	Factors of 14 are 1, 2, 7, 14. 14 ÷ 1 = 14 14 ÷ 2 = 7 14 ÷ 7 = 2 14 ÷ 14 = 1																																																																																																				
A multiple is the product of a number and another number. Every number is a multiple of itself.	The first four multiples of the number 8 are 8, 16, 24, 32																																																																																																				
Even numbers are exactly divisible by 2. They are all multiples of 2.	2, 4, 6, 8, 10 ... 2 ÷ 2 = 1 4 ÷ 2 = 2 6 ÷ 2 = 3 8 ÷ 2 = 4 10 ÷ 2 = 5																																																																																																				
Odd numbers ALWAYS leave a remainder of 1 when divided by 2.	1, 3, 5, 7, 9 ... 1 ÷ 2 = 0 Remainder 1 3 ÷ 2 = 1 Remainder 1 5 ÷ 2 = 2 Remainder 1 7 ÷ 2 = 3 Remainder 1 9 ÷ 2 = 4 Remainder 1																																																																																																				
A prime number is any number that has only two factors: itself and 1. 2 is the only EVEN prime number. Numbers that are not prime numbers are called composite numbers. 1 is a unique number. It is neither prime nor composite.	Prime numbers are highlighted on the chart below. All other numbers beside the number 1 are composite. <table><tr><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td></tr><tr><td>11</td><td>12</td><td>13</td><td>14</td><td>15</td><td>16</td><td>17</td><td>18</td><td>19</td><td>20</td></tr><tr><td>21</td><td>22</td><td>23</td><td>24</td><td>25</td><td>26</td><td>27</td><td>28</td><td>29</td><td>30</td></tr><tr><td>31</td><td>32</td><td>33</td><td>34</td><td>35</td><td>36</td><td>37</td><td>38</td><td>39</td><td>40</td></tr><tr><td>41</td><td>42</td><td>43</td><td>44</td><td>45</td><td>46</td><td>47</td><td>48</td><td>49</td><td>50</td></tr><tr><td>51</td><td>52</td><td>53</td><td>54</td><td>55</td><td>56</td><td>57</td><td>58</td><td>59</td><td>60</td></tr><tr><td>61</td><td>62</td><td>63</td><td>64</td><td>65</td><td>66</td><td>67</td><td>68</td><td>69</td><td>70</td></tr><tr><td>71</td><td>72</td><td>73</td><td>74</td><td>75</td><td>76</td><td>77</td><td>78</td><td>79</td><td>80</td></tr><tr><td>81</td><td>82</td><td>83</td><td>84</td><td>85</td><td>86</td><td>87</td><td>88</td><td>89</td><td>90</td></tr><tr><td>91</td><td>92</td><td>93</td><td>94</td><td>95</td><td>96</td><td>97</td><td>98</td><td>99</td><td>100</td></tr></table>	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54	55	56	57	58	59	60	61	62	63	64	65	66	67	68	69	70	71	72	73	74	75	76	77	78	79	80	81	82	83	84	85	86	87	88	89	90	91	92	93	94	95	96	97	98	99	100

Facts to Remember	Illustration/ Example						
A number can be represented in numerals, words and expanded form. e.g. Numeral: 45 678 Words: forty-five thousand, six hundred and seventy-eight Expanded Form: (4×10 000) + (5×1 000) + (6×100) + (7×10) + (8×1)	1. <table><tr><th>Hundreds 2</th><th>Tens 1</th><th>Units or Ones 5</th></tr><tr><td></td><td></td><td></td></tr></table> 2. Numeral:215 3. Word name:Two hundred and fifteen 4. Expanded form:(2 × 100) + (1 × 10) + (5 × 1)	Hundreds 2	Tens 1	Units or Ones 5			
Hundreds 2	Tens 1	Units or Ones 5					
							

Facts to Remember Place value is the position of the digit in the numeral. It is represented by columns on the place value chart. The value is the worth of the digit. e.g. The numeral 7 <u>8</u> 9 The place value of the digit 8 is tens. The value of the digit 8 is eighty (80). CHANGE TO Place value is the value of a digit in a number based on its position in the number. In the numeral 789: The place value of the digit 8 is tens. The value of the digit 8 is 80.	Illustration/ Example Example: 1 245 <table><tr><th>Thousands</th><th>Hundreds</th><th>Tens</th><th>Units or Ones</th></tr><tr><td>1</td><td>2</td><td>4</td><td>5</td></tr><tr><td></td><td></td><td></td><td></td></tr></table> place value of 5 is ones : value of 5 is 5 place value of 4 is tens : value of 4 is 40 place value of 2 is hundreds : value of 2 is 200 place value of 1 is thousands : value of 1 is 1000	Thousands	Hundreds	Tens	Units or Ones	1	2	4	5				
Thousands	Hundreds	Tens	Units or Ones										
1	2	4	5										
													
Ascending Order To arrange numbers in ascending order, place them from smallest (first) to largest (last).	Example: Place 17, 5, 9 and 8 in ascending order. Answer: 5, 8, 9, 17 Example: Place 3, 1, 19, 12, 9, 2 and 7 in ascending order. Answer: 1, 2, 3, 7, 9, 12, 19												
Descending Order To arrange numbers in descending order, place them from largest (first) to smallest (last).	Example: Place 17, 5, 9 and 8 in descending order. Answer: 17, 9, 8, 5 Example: Place 3, 1, 19, 12, 9, 2 and 7 in descending order. Answer: 19, 12, 9, 7, 3, 2, 1												

Facts to Remember	Illustration/ Example																																																																																																																									
A basic Addition Fact is defined as the sum of two one-digit numbers. The sum of any number added to zero gives the same number. e.g. 7 + 0 = 7	The 100 Addition facts of single digit numbers: <table><tr><td>+</td><td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td></tr><tr><td>0</td><td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td></tr><tr><td>1</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td></tr><tr><td>2</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td></tr><tr><td>3</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td></tr><tr><td>4</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td><td>13</td></tr><tr><td>5</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td><td>13</td><td>14</td></tr><tr><td>6</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td><td>13</td><td>14</td><td>15</td></tr><tr><td>7</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td><td>13</td><td>14</td><td>15</td><td>16</td></tr><tr><td>8</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td><td>13</td><td>14</td><td>15</td><td>16</td><td>17</td></tr><tr><td>9</td><td>9</td><td>10</td><td>11</td><td>12</td><td>13</td><td>14</td><td>15</td><td>16</td><td>17</td><td>18</td></tr></table> Example: 4 + 5 = 9 Example: 8 + 7 = 15	+	0	1	2	3	4	5	6	7	8	9	0	0	1	2	3	4	5	6	7	8	9	1	1	2	3	4	5	6	7	8	9	10	2	2	3	4	5	6	7	8	9	10	11	3	3	4	5	6	7	8	9	10	11	12	4	4	5	6	7	8	9	10	11	12	13	5	5	6	7	8	9	10	11	12	13	14	6	6	7	8	9	10	11	12	13	14	15	7	7	8	9	10	11	12	13	14	15	16	8	8	9	10	11	12	13	14	15	16	17	9	9	10	11	12	13	14	15	16	17	18
+	0	1	2	3	4	5	6	7	8	9

9	9	10	11	12	13	14	15	16	17	18																																																																																																																
Addition on the number line When adding on a number line, move to the right.	Example: 3 + 4 Begin at 3, then move 4 steps to the right. <u>3 + 4 = 7</u>  Answer: 7																																																																																																																									

Facts to Remember	Illustration/ Example																																																																																																																																																						
Addition with regrouping	Example: Add 4529 + 733 Place all digits in the correct columns. <table><tr><td></td><td>TH</td><td>H</td><td>T</td><td>O</td></tr><tr><td></td><td>4</td><td>5</td><td>2</td><td>9</td></tr><tr><td>+</td><td></td><td>7</td><td>3</td><td>3</td></tr><tr><td colspan="5"> </td></tr></table> Add the digits in the ones column: 9 + 3 = 12. The number 12 represents 1 group of ten and 2 ones. Place the digit 2 in the answer space for the ones column and the digit 1 above the tens column. <table><tr><td></td><td></td><td></td><td></td><td>1</td></tr><tr><td></td><td>TH</td><td>H</td><td>T</td><td>O</td></tr><tr><td></td><td>4</td><td>5</td><td>2</td><td>9</td></tr><tr><td>+</td><td></td><td>7</td><td>3</td><td>3</td></tr><tr><td colspan="5"> </td></tr><tr><td></td><td></td><td></td><td></td><td>2</td></tr><tr><td></td><td></td><td></td><td>1</td><td>2</td></tr></table> Add the digits in the tens column: 1 + 2 + 3 = 6. Place the digit 6 in the answer space for the tens column. <table><tr><td></td><td></td><td></td><td></td><td>1</td></tr><tr><td></td><td>TH</td><td>H</td><td>T</td><td>O</td></tr><tr><td></td><td>4</td><td>5</td><td>2</td><td>9</td></tr><tr><td>+</td><td></td><td>7</td><td>3</td><td>3</td></tr><tr><td colspan="5"> </td></tr><tr><td></td><td></td><td></td><td>6</td><td>2</td></tr></table> Add the digits in the hundreds column: 5 + 7 = 12. The number 12 represents 1200, one thousand and two hundreds. Place the digit 2 in the answer space for the hundreds column. Place the 1 from the number 12 above the thousands column. <table><tr><td></td><td></td><td>1</td><td></td><td>1</td></tr><tr><td></td><td>TH</td><td>H</td><td>T</td><td>O</td></tr><tr><td></td><td>4</td><td>5</td><td>2</td><td>9</td></tr><tr><td>+</td><td></td><td>7</td><td>3</td><td>3</td></tr><tr><td colspan="5"> </td></tr><tr><td></td><td></td><td>2</td><td>6</td><td>2</td></tr><tr><td></td><td>1</td><td>2</td><td></td><td></td></tr></table> Add the digits in the thousands column: 1 + 4 = 5. Place the digit 5 in the answer space for the thousands column. <table><tr><td></td><td></td><td>1</td><td></td><td>1</td></tr><tr><td></td><td>TH</td><td>H</td><td>T</td><td>O</td></tr><tr><td></td><td>4</td><td>5</td><td>2</td><td>9</td></tr><tr><td>+</td><td></td><td>7</td><td>3</td><td>3</td></tr><tr><td colspan="5"> </td></tr><tr><td></td><td>5</td><td>2</td><td>6</td><td>2</td></tr></table>		TH	H	T	O		4	5	2	9	+		7	3	3										1		TH	H	T	O		4	5	2	9	+		7	3	3										2				1	2					1		TH	H	T	O		4	5	2	9	+		7	3	3									6	2			1		1		TH	H	T	O		4	5	2	9	+		7	3	3								2	6	2		1	2					1		1		TH	H	T	O		4	5	2	9	+		7	3	3							5	2	6	2

Commutative Property for Addition	Example: 2 + 3 + 5 = 10 3 + 5 + 2 = 10 5 + 3 + 2 = 10 same result																																																																																																																																																						

Facts to Remember	Illustration/ Example
Subtraction on the number line When subtracting on a number line, move to the left or move backward.	Example: $6 - 4 = 2$ Begin at 6, then move 4 steps backward (to the left).  Answer: 2

Facts to Remember	Illustration/ Example																																																																																															
Subtraction with regrouping	Example: Subtract 4792 from 6538 Place all digits in the correct columns <table><tr><td></td><td>TH</td><td>H</td><td>T</td><td>O</td></tr><tr><td></td><td>6</td><td>5</td><td>3</td><td>8</td></tr><tr><td>–</td><td>4</td><td>7</td><td>9</td><td>2</td></tr></table> In the ones column, subtract 2 from 8: $8 - 2 = 6$. Place the digit 6 in the answer space for the ones column. <table><tr><td></td><td>TH</td><td>H</td><td>T</td><td>O</td></tr><tr><td></td><td>6</td><td>5</td><td>3</td><td>8</td></tr><tr><td>–</td><td>4</td><td>7</td><td>9</td><td>2</td></tr><tr><td></td><td></td><td></td><td></td><td>6</td></tr></table> In the tens column, 3 is less than 9. To subtract, you need to take 1 hundred and regroup to 10 tens. 1 hundred is the same as 10 tens. 10 tens added to 3 tens equal 13 tens. 13 tens subtract 9 tens equal 4 tens. Place the digit 4 in the answer space for the tens column. <table><tr><td></td><td>TH</td><td>H</td><td>T</td><td>O</td></tr><tr><td></td><td>6</td><td>5⁴</td><td>13</td><td>8</td></tr><tr><td>–</td><td>4</td><td>7</td><td>9</td><td>2</td></tr><tr><td></td><td></td><td></td><td>4</td><td>6</td></tr></table> In the hundreds column, 4 is less than 7. To subtract, you need to take 1 thousand and regroup to 10 hundreds. 10 hundreds added to 4 hundreds equal 14 hundreds. 14 hundreds subtract 7 hundreds equal 7 hundreds. Place the digit 7 in the answer space for the hundreds column. <table><tr><td></td><td>TH</td><td>H</td><td>T</td><td>O</td></tr><tr><td></td><td>6⁵</td><td>5¹⁴</td><td>13</td><td>8</td></tr><tr><td>–</td><td>4</td><td>7</td><td>9</td><td>2</td></tr><tr><td></td><td>1</td><td>7</td><td>4</td><td>6</td></tr></table> In the thousands column, subtract 4 from 5: $5 - 4 = 1$. Place the digit 1 in the answer space for the thousands column. <table><tr><td></td><td>TH</td><td>H</td><td>T</td><td>O</td></tr><tr><td></td><td>6⁵</td><td>5¹⁴</td><td>13</td><td>8</td></tr><tr><td>–</td><td>4</td><td>7</td><td>9</td><td>2</td></tr><tr><td></td><td>1</td><td>7</td><td>4</td><td>6</td></tr></table>		TH	H	T	O		6	5	3	8	–	4	7	9	2		TH	H	T	O		6	5	3	8	–	4	7	9	2					6		TH	H	T	O		6	5 ⁴	13	8	–	4	7	9	2				4	6		TH	H	T	O		6 ⁵	5 ¹⁴	13	8	–	4	7	9	2		1	7	4	6		TH	H	T	O		6 ⁵	5 ¹⁴	13	8	–	4	7	9	2		1	7	4	6

Facts to Remember	Illustration/ Example
The product of 3 and 4 is 12. $3 \times 4 = 12$	Example: Three ways of calculating 246×3 1. Area Model: $(3 \times 200) + (3 \times 40) + (3 \times 6) = 600 + 120 + 18 = 738$ 3×200  3×40  3×6  2. Regrouping  $6 \times 3 = 18$ (1 ten and 8 ones). Regroup and add 1 to the tens column. $4 \text{ tens} \times 3 = 12 \text{ tens}$ (1 hundred and 2 tens) Regroup and add 1 to the hundreds column. 3. Repeated Addition $\begin{array}{r} 246 \\ 246 \\ + 246 \\ \hline 738 \end{array}$

Facts to Remember	Illustration/ Example																																																																																																																																																																																																				
Multiplication using Partial Products	Example: 21×12 2 1 × 1 2 2 4 1 2 2 5 2 Ones multiplied by Ones Tens multiplied by Ones Ones multiplied by Tens Tens multiplied by Tens																																																																																																																																																																																																				
The product of any number and 1 is the same number. e.g. $7 \times 1 = 1 \times 7 = 7$ The product of any number and 0 is 0. e.g. $7 \times 0 = 0 \times 7 = 0$ Pattern for multiplication by 10: $1 \times 10 = 10$ $2 \times 10 = 20$ $3 \times 10 = 30$ $4 \times 10 = 40$ $5 \times 10 = 50$	Multiplication Facts to 144 <table><tr><th>X</th><th>0</th><th>1</th><th>2</th><th>3</th><th>4</th><th>5</th><th>6</th><th>7</th><th>8</th><th>9</th><th>10</th><th>11</th><th>12</th></tr><tr><th>0</th><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr><tr><th>1</th><td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td><td>10</td><td>11</td><td>12</td></tr><tr><th>2</th><td>0</td><td>2</td><td>4</td><td>6</td><td>8</td><td>10</td><td>12</td><td>14</td><td>16</td><td>18</td><td>20</td><td>22</td><td>24</td></tr><tr><th>3</th><td>0</td><td>3</td><td>6</td><td>9</td><td>12</td><td>15</td><td>18</td><td>21</td><td>24</td><td>27</td><td>30</td><td>33</td><td>36</td></tr><tr><th>4</th><td>0</td><td>4</td><td>8</td><td>12</td><td>16</td><td>20</td><td>24</td><td>28</td><td>32</td><td>36</td><td>40</td><td>44</td><td>48</td></tr><tr><th>5</th><td>0</td><td>5</td><td>10</td><td>15</td><td>20</td><td>25</td><td>30</td><td>35</td><td>40</td><td>45</td><td>50</td><td>55</td><td>60</td></tr><tr><th>6</th><td>0</td><td>6</td><td>12</td><td>18</td><td>24</td><td>30</td><td>36</td><td>42</td><td>48</td><td>54</td><td>60</td><td>66</td><td>72</td></tr><tr><th>7</th><td>0</td><td>7</td><td>14</td><td>21</td><td>28</td><td>35</td><td>42</td><td>49</td><td>56</td><td>63</td><td>70</td><td>77</td><td>84</td></tr><tr><th>8</th><td>0</td><td>8</td><td>16</td><td>24</td><td>32</td><td>40</td><td>48</td><td>56</td><td>64</td><td>72</td><td>80</td><td>88</td><td>96</td></tr><tr><th>9</th><td>0</td><td>9</td><td>18</td><td>27</td><td>36</td><td>45</td><td>54</td><td>63</td><td>72</td><td>81</td><td>90</td><td>99</td><td>108</td></tr><tr><th>10</th><td>0</td><td>10</td><td>20</td><td>30</td><td>40</td><td>50</td><td>60</td><td>70</td><td>80</td><td>90</td><td>100</td><td>110</td><td>120</td></tr><tr><th>11</th><td>0</td><td>11</td><td>22</td><td>33</td><td>44</td><td>55</td><td>66</td><td>77</td><td>88</td><td>99</td><td>110</td><td>121</td><td>132</td></tr><tr><th>12</th><td>0</td><td>12</td><td>24</td><td>36</td><td>48</td><td>60</td><td>72</td><td>84</td><td>96</td><td>108</td><td>120</td><td>132</td><td>144</td></tr></table>	X	0	1	2	3	4	5	6	7	8	9	10	11	12	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	2	3	4	5	6	7	8	9	10	11	12	2	0	2	4	6	8	10	12	14	16	18	20	22	24	3	0	3	6	9	12	15	18	21	24	27	30	33	36	4	0	4	8	12	16	20	24	28	32	36	40	44	48	5	0	5	10	15	20	25	30	35	40	45	50	55	60	6	0	6	12	18	24	30	36	42	48	54	60	66	72	7	0	7	14	21	28	35	42	49	56	63	70	77	84	8	0	8	16	24	32	40	48	56	64	72	80	88	96	9	0	9	18	27	36	45	54	63	72	81	90	99	108	10	0	10	20	30	40	50	60	70	80	90	100	110	120	11	0	11	22	33	44	55	66	77	88	99	110	121	132	12	0	12	24	36	48	60	72	84	96	108	120	132	144

Commutative Property for Multiplication This property states that if two or more numbers are multiplied the result will be the same no matter their order.	Example: $5 \times 3 = 15$ $3 \times 5 = 15$ same result Example: $4 \times 2 \times 6 = 48$ $6 \times 4 \times 2 = 48$ $2 \times 4 \times 6 = 48$ same result																																																																																																																																																																																																				

Facts to Remember	Illustration/ Example														
Division Algorithm	Example: Divide 4707 by 32 We are dividing by 32. Here are some multiplication facts for 32: $1 \times 32 = 32$ $4 \times 32 = 128$ $7 \times 32 = 224$ <table><tr><td>$\begin{array}{r} 0 \ 1 \\ 32 \overline{) 4 \ 7 \ 0 \ 7} \\ \underline{-3 \ 2} \\ 1 \ 5 \end{array}$</td><td>$\begin{array}{r} 0 \ 1 \ 4 \\ 32 \overline{) 4 \ 7 \ 0 \ 7} \\ \underline{-3 \ 2} \\ 1 \ 5 \ 0 \\ \underline{-1 \ 2 \ 8} \\ 2 \ 2 \end{array}$</td><td>$\begin{array}{r} 0 \ 1 \ 4 \ 7 \\ 32 \overline{) 4 \ 7 \ 0 \ 7} \\ \underline{-3 \ 2} \\ 1 \ 5 \ 0 \\ \underline{-1 \ 2 \ 8} \\ 2 \ 2 \ 7 \\ \underline{-2 \ 2 \ 4} \\ 3 \end{array}$</td></tr><tr><td></td><td><table><tr><td>$47 \text{ hundreds} \div 32 = 100$ sets of 32 with a remainder of 15 hundreds.</td><td>$150 \text{ tens} \div 32 = 40$ sets of 32 with a remainder of 22 tens</td><td>$227 \div 32 = 7$ sets of 32 with a remainder of 3</td></tr></table></td></tr><tr><td></td><td> 4707 is the dividend 32 is the divisor 147 is the quotient 3 is the remainder </td></tr><tr><td>Zero divided by any number equals zero.</td><td> Example: $\frac{0}{5} = 0$</td></tr><tr><td>Any number divided by itself equals 1, except the number 0.</td><td> Examples: $1 \div 1 = 1$$2 \div 2 = 1$$3 \div 3 = 1$$10 \div 10 = 1$</td></tr></table>	$\begin{array}{r} 0 \ 1 \\ 32 \overline{) 4 \ 7 \ 0 \ 7} \\ \underline{-3 \ 2} \\ 1 \ 5 \end{array}$	$\begin{array}{r} 0 \ 1 \ 4 \\ 32 \overline{) 4 \ 7 \ 0 \ 7} \\ \underline{-3 \ 2} \\ 1 \ 5 \ 0 \\ \underline{-1 \ 2 \ 8} \\ 2 \ 2 \end{array}$	$\begin{array}{r} 0 \ 1 \ 4 \ 7 \\ 32 \overline{) 4 \ 7 \ 0 \ 7} \\ \underline{-3 \ 2} \\ 1 \ 5 \ 0 \\ \underline{-1 \ 2 \ 8} \\ 2 \ 2 \ 7 \\ \underline{-2 \ 2 \ 4} \\ 3 \end{array}$		<table><tr><td>$47 \text{ hundreds} \div 32 = 100$ sets of 32 with a remainder of 15 hundreds.</td><td>$150 \text{ tens} \div 32 = 40$ sets of 32 with a remainder of 22 tens</td><td>$227 \div 32 = 7$ sets of 32 with a remainder of 3</td></tr></table>	$47 \text{ hundreds} \div 32 = 100$ sets of 32 with a remainder of 15 hundreds.	$150 \text{ tens} \div 32 = 40$ sets of 32 with a remainder of 22 tens	$227 \div 32 = 7$ sets of 32 with a remainder of 3		4707 is the dividend 32 is the divisor 147 is the quotient 3 is the remainder	Zero divided by any number equals zero.	Example: $\frac{0}{5} = 0$	Any number divided by itself equals 1, except the number 0.	Examples: $1 \div 1 = 1$ $2 \div 2 = 1$ $3 \div 3 = 1$ $10 \div 10 = 1$
$\begin{array}{r} 0 \ 1 \\ 32 \overline{) 4 \ 7 \ 0 \ 7} \\ \underline{-3 \ 2} \\ 1 \ 5 \end{array}$	$\begin{array}{r} 0 \ 1 \ 4 \\ 32 \overline{) 4 \ 7 \ 0 \ 7} \\ \underline{-3 \ 2} \\ 1 \ 5 \ 0 \\ \underline{-1 \ 2 \ 8} \\ 2 \ 2 \end{array}$	$\begin{array}{r} 0 \ 1 \ 4 \ 7 \\ 32 \overline{) 4 \ 7 \ 0 \ 7} \\ \underline{-3 \ 2} \\ 1 \ 5 \ 0 \\ \underline{-1 \ 2 \ 8} \\ 2 \ 2 \ 7 \\ \underline{-2 \ 2 \ 4} \\ 3 \end{array}$													
	<table><tr><td>$47 \text{ hundreds} \div 32 = 100$ sets of 32 with a remainder of 15 hundreds.</td><td>$150 \text{ tens} \div 32 = 40$ sets of 32 with a remainder of 22 tens</td><td>$227 \div 32 = 7$ sets of 32 with a remainder of 3</td></tr></table>	$47 \text{ hundreds} \div 32 = 100$ sets of 32 with a remainder of 15 hundreds.	$150 \text{ tens} \div 32 = 40$ sets of 32 with a remainder of 22 tens	$227 \div 32 = 7$ sets of 32 with a remainder of 3											
$47 \text{ hundreds} \div 32 = 100$ sets of 32 with a remainder of 15 hundreds.	$150 \text{ tens} \div 32 = 40$ sets of 32 with a remainder of 22 tens	$227 \div 32 = 7$ sets of 32 with a remainder of 3													
	4707 is the dividend 32 is the divisor 147 is the quotient 3 is the remainder														
Zero divided by any number equals zero.	Example: $\frac{0}{5} = 0$														
Any number divided by itself equals 1, except the number 0.	Examples: $1 \div 1 = 1$ $2 \div 2 = 1$ $3 \div 3 = 1$ $10 \div 10 = 1$														

Facts to Remember	Illustration/ Example
In multi-step word problems, one or more steps must be solved in order to get the information needed to solve the final question.	Example: Jason played three games at the mall. He won 33 tickets from Basketball Hoops and 18 tickets from Air Hockey. He won three times the number of tickets from Car Racing as he did from Air Hockey. How many tickets did Jason win altogether? Solution 1: No. of tickets won from Basketball Hoops = 33 No. of tickets won from Air Hockey = 18 Step 1: No. of tickets won from Car Racing = $18 \times 3 = 54$ Step 2: Total number of tickets won = Tickets from Basketball Hoops and Air Hockey and Car Racing = $33 + 18 + 54 = 105$ Solution 2: Step 1: No. of tickets won in Air Hockey & Car Racing = $18 \times 4 = 72$ Step 2: Total number of tickets won = Air Hockey and Car Racing Tickets + Basketball Hoops Tickets = $72 + 33 = 105$ Answer: Jason won 105 tickets altogether.
	Example: Marcus had 600 marbles. He gave away 175 marbles and put the remaining marbles equally into 5 bags. How many marbles were there in each bag? Solution: Step 1: $600 - 175 = 425$ He had 425 marbles left. Step 2: $425 \div 5 = 85$ There were 85 marbles in each bag. Answer: Each bag had 85 marbles.

Facts to Remember	Illustration/ Example																													
The square of a number is the product of the number and itself. Square numbers can be represented by objects arranged as a square as shown below: e.g. 2^2 is read as “the square of 2”. 3^2 is read as “the square of 3”. 4^2 is read as “the square of 4”. 2^2 <table><tr><td>1</td><td>2</td></tr><tr><td>3</td><td>4</td></tr></table> $2 \times 2 = 4$  4 3^2 <table><tr><td>1</td><td>2</td><td>3</td></tr><tr><td>4</td><td>5</td><td>6</td></tr><tr><td>7</td><td>8</td><td>9</td></tr></table> $3 \times 3 = 9$  9 4^2 <table><tr><td>1</td><td>2</td><td>3</td><td>4</td></tr><tr><td>5</td><td>6</td><td>7</td><td>8</td></tr><tr><td>9</td><td>10</td><td>11</td><td>12</td></tr><tr><td>13</td><td>14</td><td>15</td><td>16</td></tr></table> $4 \times 4 = 16$  16 The square number pattern is shown below: 1 = 1^2 = 1 4 = 2^2 = 1 + 3 9 = 3^2 = 1 + 3 + 5 16 = 4^2 = 1 + 3 + 5 + 7 25 = 5^2 = 1 + 3 + 5 + 7 + 9 36 = 6^2 = 1 + 3 + 5 + 7 + 9 + 11 The pattern rule is the sum of the odd numbers.	1	2	3	4	1	2	3	4	5	6	7	8	9	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	Example: $4 \times 4 = 16$, so 16 is a square number  Square Numbers $1^2 = 1 \times 1$ $1^2 = 1$ $2^2 = 2 \times 2$ $2^2 = 4$ $3^2 = 3 \times 3$ $3^2 = 9$ $4^2 = 4 \times 4$ $4^2 = 16$ $5^2 = 5 \times 5$ $5^2 = 25$ $6^2 = 6 \times 6$ $6^2 = 36$ $7^2 = 7 \times 7$ $7^2 = 49$ $8^2 = 8 \times 8$ $8^2 = 64$ $9^2 = 9 \times 9$ $9^2 = 81$ $10^2 = 10 \times 10$ $10^2 = 100$ $11^2 = 121$ $12^2 = 144$ $13^2 = 169$ $14^2 = 196$ $15^2 = 225$ $16^2 = 256$ $17^2 = 289$ $18^2 = 324$ $19^2 = 361$ $20^2 = 400$ $30^2 = 900$ $40^2 = 1600$ $50^2 = 2500$

Facts to Remember	Illustration/ Example																																																																											
The square root of a number is that number when multiplied by itself would give the original number. $\sqrt{\quad}$ is the symbol used for the square root. e.g. $2^2 = 4$, so $\sqrt{4} = 2$ $\sqrt{4}$ is read as “the square root of 4”. $\sqrt{9}$ is read as “the square root of 9”.	A square root of 9 is 3, because the product of 3 and itself is 9.  $3^2 = 9$, so $\sqrt{9} = 3$																																																																											
Square Roots	Examples:																																																																											
	<table><tr><td>$\sqrt{1}$</td><td>= 1</td><td>.....</td><td>1^2</td><td>= 1</td></tr><tr><td>$\sqrt{4}$</td><td>= 2</td><td>.....</td><td>2^2</td><td>= 4</td></tr><tr><td>$\sqrt{9}$</td><td>= 3</td><td>.....</td><td>3^2</td><td>= 9</td></tr><tr><td>$\sqrt{16}$</td><td>= 4</td><td>.....</td><td>4^2</td><td>= 16</td></tr><tr><td>$\sqrt{25}$</td><td>= 5</td><td>.....</td><td>5^2</td><td>= 25</td></tr><tr><td>$\sqrt{36}$</td><td>= 6</td><td>.....</td><td>6^2</td><td>= 36</td></tr><tr><td>$\sqrt{49}$</td><td>= 7</td><td>.....</td><td>7^2</td><td>= 49</td></tr><tr><td>$\sqrt{64}$</td><td>= 8</td><td>.....</td><td>8^2</td><td>= 64</td></tr><tr><td>$\sqrt{81}$</td><td>= 9</td><td>.....</td><td>9^2</td><td>= 81</td></tr><tr><td>$\sqrt{100}$</td><td>= 10</td><td>.....</td><td>10^2</td><td>= 100</td></tr><tr><td>$\sqrt{121}$</td><td>= 11</td><td></td><td>11^2</td><td>= 121</td></tr><tr><td>$\sqrt{144}$</td><td>= 12</td><td></td><td>12^2</td><td>= 144</td></tr><tr><td>$\sqrt{169}$</td><td>= 13</td><td></td><td>13^2</td><td>= 169</td></tr><tr><td>$\sqrt{196}$</td><td>= 14</td><td></td><td>14^2</td><td>= 196</td></tr><tr><td>$\sqrt{225}$</td><td>= 15</td><td></td><td>15^2</td><td>= 225</td></tr></table>	$\sqrt{1}$	= 1		1^2	= 1	$\sqrt{4}$	= 2		2^2	= 4	$\sqrt{9}$	= 3		3^2	= 9	$\sqrt{16}$	= 4		4^2	= 16	$\sqrt{25}$	= 5		5^2	= 25	$\sqrt{36}$	= 6		6^2	= 36	$\sqrt{49}$	= 7		7^2	= 49	$\sqrt{64}$	= 8		8^2	= 64	$\sqrt{81}$	= 9		9^2	= 81	$\sqrt{100}$	= 10		10^2	= 100	$\sqrt{121}$	= 11		11^2	= 121	$\sqrt{144}$	= 12		12^2	= 144	$\sqrt{169}$	= 13		13^2	= 169	$\sqrt{196}$	= 14		14^2	= 196	$\sqrt{225}$	= 15		15^2	= 225

$10^3 = 10 \times 10 \times 10$		$10^3 = 1000$																																	

Facts to Remember	Illustration/ Example
A number pattern is a set of numbers that are in a particular order based on a rule. e.g. 3, 8, 13, 18, 23, 28, 33, 38, ... The pattern rule is “add 5”. Number patterns can be repeating, increasing or decreasing. Examples of repeating number patterns: 1 1 1 1 1 1 123 123 123 123 75 75 75 75	Example: 27, 24, 21, 18, __ Pattern rule: “subtract 3” 27, $24 = 27 - 3,$ $21 = 24 - 3,$ $18 = 21 - 3,$ $15 = 18 - 3$ The missing number in the pattern is 15. This is a decreasing pattern. Example: 3, 4, 6, 9, 13, 18, __ Pattern rule: Add 1 to the first number, add 2 to the second number, add 3 to the third number, etc. 3, $4 = 3 + 1,$ $6 = 4 + 2,$ $9 = 6 + 3,$ $13 = 9 + 4,$ $18 = 13 + 5$ The missing number in the pattern is 24. This is an increasing pattern. Example: 64, 32, 16, 8, __ Pattern rule: Divide by 2 64 $32 = 64 \div 2,$ $16 = 32 \div 2,$ $8 = 16 \div 2,$ $4 = 8 \div 2$ The missing number in the pattern is 4. This is a decreasing pattern.

A. NUMBER - Fractions																																																			
Facts to Remember	Illustration/ Example																																																		
A fraction is a part of a whole. For the purpose of naming fractions, wholes are divided into equal parts. $\frac{1}{2}$ → numerator → how many parts $\frac{1}{2}$ → denominator → names the part Here are some of the most common fractions, and how to call them: $\frac{1}{2}$ is one-half $\frac{1}{3}$ is one-third $\frac{1}{4}$ is one-quarter $\frac{1}{5}$ is one-fifth and so on $\frac{3}{7}$ is read as three-sevenths A unit fraction is a fraction where the numerator is 1. E.g. $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{1}{5}$, $\frac{1}{10}$ and so on.	<table><tr><th>Wholes divided into equal parts</th><th>Number of shaded parts</th><th>Number of equal parts in the whole</th><th>Fraction shaded</th><th>Name of fraction</th></tr><tr><td></td><td>1</td><td>4</td><td>$\frac{1}{4}$</td><td>One quarter one - fourth</td></tr><tr><td></td><td>3</td><td>8</td><td>$\frac{3}{8}$</td><td>Three - eighth</td></tr><tr><td></td><td>1</td><td>3</td><td>$\frac{1}{3}$</td><td>One - third</td></tr><tr><td></td><td>2</td><td>4</td><td>$\frac{2}{4}$ or $\frac{1}{2}$</td><td>One- half</td></tr><tr><td></td><td>2</td><td>3</td><td>$\frac{2}{3}$</td><td>Two - third</td></tr><tr><td></td><td>3</td><td>4</td><td>$\frac{3}{4}$</td><td>Three - quarters or Three- fourth</td></tr><tr><td></td><td>7</td><td>8</td><td>$\frac{7}{8}$</td><td>Seven - eighth</td></tr><tr><td></td><td>4</td><td>4</td><td>$\frac{4}{4} = 1$</td><td>Whole Or Four-fourth</td></tr><tr><td></td><td>0</td><td>4</td><td>$\frac{0}{4} = 0$</td><td>Zero Or Zero - fourth</td></tr></table>	Wholes divided into equal parts	Number of shaded parts	Number of equal parts in the whole	Fraction shaded	Name of fraction		1	4	$\frac{1}{4}$	One quarter one - fourth		3	8	$\frac{3}{8}$	Three - eighth		1	3	$\frac{1}{3}$	One - third		2	4	$\frac{2}{4}$ or $\frac{1}{2}$	One- half		2	3	$\frac{2}{3}$	Two - third		3	4	$\frac{3}{4}$	Three - quarters or Three- fourth		7	8	$\frac{7}{8}$	Seven - eighth		4	4	$\frac{4}{4} = 1$	Whole Or Four-fourth		0	4	$\frac{0}{4} = 0$	Zero Or Zero - fourth
Wholes divided into equal parts	Number of shaded parts	Number of equal parts in the whole	Fraction shaded	Name of fraction																																															
	1	4	$\frac{1}{4}$	One quarter one - fourth																																															
	3	8	$\frac{3}{8}$	Three - eighth																																															
	1	3	$\frac{1}{3}$	One - third																																															
	2	4	$\frac{2}{4}$ or $\frac{1}{2}$	One- half																																															
	2	3	$\frac{2}{3}$	Two - third																																															
	3	4	$\frac{3}{4}$	Three - quarters or Three- fourth																																															
	7	8	$\frac{7}{8}$	Seven - eighth																																															
	4	4	$\frac{4}{4} = 1$	Whole Or Four-fourth																																															
	0	4	$\frac{0}{4} = 0$	Zero Or Zero - fourth																																															

Facts to Remember	Illustration/ Example
You can create equivalent fractions by multiplying or dividing both top and bottom by the same number. 	The rule to remember is: <i>"Change the bottom using multiply or divide, and the same to the top must be applied"</i> Here is why those fractions are really the same:  $\frac{1}{4} \xrightarrow{\times 2} \frac{2}{8} \xrightarrow{\times 2} \frac{4}{16}$ Here are some more equivalent fractions, this time by dividing:  $\frac{25}{100} \xrightarrow{\div 5} \frac{5}{20} \xrightarrow{\div 5} \frac{1}{4}$
Ordering Fractions When the numerator stays the same, and the denominator increases, the value of the fraction decreases, i.e. the fraction is smaller. When the numerator stays the same, and the denominator decreases, the value of the fraction increases, i.e. the fraction is larger.	Example: $\frac{1}{2}, \frac{1}{4}, \frac{1}{7}, \frac{1}{10}$ The fraction is getting smaller. $\frac{3}{7}, \frac{3}{6}, \frac{3}{5}, \frac{3}{4}$ The fraction is getting larger.

Facts to Remember	Illustration/ Example
We can compare two fractions to discover which is larger or smaller. There are two main ways to compare fractions: 1) Using the same denominator. $\text{Compare } \frac{3}{4} \text{ \& } \frac{2}{3}$ $\frac{3 \times 3}{4 \times 3} = \frac{9}{12} \quad \frac{2 \times 4}{3 \times 4} = \frac{8}{12}$ $\frac{9}{12} > \frac{8}{12}$ 2) Using decimal fractions	Example: Which is bigger: $\frac{3}{8}$ or $\frac{5}{12}$? Solution: Make the denominators the same using equivalent fractions $\times 3$ $\times 3$ and $\times 2$ $\times 2$ $\frac{9}{24}$ is smaller than $\frac{10}{24}$, because 9 is smaller than 10. Answer: $\frac{5}{12}$ is the larger fraction. Example: $\frac{2}{5} = 0.40$ and $\frac{7}{10} = 0.70$ so $\frac{7}{10}$ is bigger.
There are three types of fractions: 1) Proper Fraction (Common Fraction) - A fraction with a numerator smaller than its denominator. The value of the fraction is always less than one or a whole. 2) Improper Fraction- A fraction with its numerator larger than its denominator. Improper fractions always have a value greater than 1. 3) Mixed Number - A value expressed using both a whole number and a proper fraction e.g. $1\frac{1}{2}$ 1 is the whole number and $\frac{1}{2}$ is the fraction.	Example: Smaller $\longrightarrow$ $\frac{3}{5}$ Larger $\longrightarrow$ $\frac{3}{5}$ Proper Fraction Larger (or equal) $\longrightarrow$ $\frac{9}{5}$ Smaller (or equal) $\longrightarrow$ $\frac{9}{5}$ Improper Fraction $2\frac{1}{2}$ Mixed Number

Facts to Remember	Illustration/ Example
Addition of fractions with the same denominator Add the numerator and keep the same denominator.	Example: Adding sevenths Three sevenths add two sevenths equals five sevenths. 
Addition of a fraction to a whole number 1  $\frac{3}{4}$  One whole: $1 = \frac{4}{4}$ $1 + \frac{3}{4} = \frac{4}{4} + \frac{3}{4}$ $= \frac{7}{4} \text{ (Improper Fraction) OR}$ $= 1 \frac{3}{4} \text{ (Mixed Number)}$	Example: Add 1 and $\frac{2}{5}$ 1 whole = $\frac{5}{5}$ $1 + \frac{2}{5} = \frac{5}{5} + \frac{2}{5}$ $= \frac{7}{5} \text{ (Improper Fraction) OR}$ $= 1 \frac{2}{5} \text{ (Mixed Number)}$

Facts to Remember	Illustration/ Example
Subtraction of fractions with the same denominator Subtract the numerator and keep the denominator.	Example: Subtracting quarters Three quarters subtract two quarters = one quarter 
Subtraction of a fraction from a whole number $3 - \frac{2}{3} = 2\frac{1}{3}$  3 wholes = $\frac{9}{3}$ $\frac{9}{3} - \frac{2}{3} = \frac{7}{3} \text{ (Improper Fraction) OR}$ $= 2\frac{1}{3} \text{ (Mixed Number)}$	Example: Subtract $\frac{2}{7}$ from 5 $5 - \frac{2}{7} = \frac{35}{7} - \frac{2}{7}$ $= \frac{33}{7} \text{ (Improper Fraction) OR}$ $= 4\frac{5}{7} \text{ (Mixed Number)}$

Facts to Remember	Illustration/ Example
Conversion of an Improper Fraction to a Mixed Number To convert an improper fraction to a mixed number, follow these steps: - Find the number of wholes - Express the remainder as a fraction	Example: Convert $\frac{11}{4}$ to a mixed number. Solution: $\frac{11}{4} = \frac{4}{4} + \frac{4}{4} + \frac{3}{4} = 1 + 1 + \frac{3}{4} = 2\frac{3}{4}$ $\frac{11}{4} = 2$ wholes with a remainder of $\frac{3}{4}$
Conversion of a Mixed number to an Improper Fraction To convert a mixed number to an improper fraction, follow these steps: - Express wholes as fractions - Simplify the numerator - State the result Changing a Mixed Fraction to an Improper Fraction  $5\frac{1}{4} = 5 + \frac{1}{4}$ $= \frac{4}{4} + \frac{4}{4} + \frac{4}{4} + \frac{4}{4} + \frac{4}{4} + \frac{1}{4}$ $= \frac{5 \times 4 + 1}{4}$ $= \frac{21}{4}$	Example: Convert $3\frac{2}{5}$ to an improper fraction. Solution: $3\frac{2}{5} = 3 + \frac{2}{5}$ $= \frac{5}{5} + \frac{5}{5} + \frac{5}{5} + \frac{2}{5} \text{ (express wholes as fractions)}$ $= \frac{5+5+5+2}{5} = \frac{(3 \times 5) + 2}{5}$ $= \frac{17}{5} \text{ (simplify the numerator)}$ Answer: $\frac{17}{5}$

Facts to Remember	Illustration/ Example
Calculate the whole given a part expressed as a unit fraction. Draw diagrams to show information given about the fraction of a number.	Example: $\frac{1}{5}$ of a number is 20. What is the number?  $\frac{1}{5}$ of a number is 20. The whole or $\frac{5}{5}$ of the number is 100. Answer: The number is 100.

Facts to Remember	Illustration/ Example
You can find the whole number given a fraction of the number using bar modeling. e.g. $\frac{3}{5}$ of a group of children were girls. If there were 24 girls, how many children were there in the group?  3 units = 24 1 unit = $24 \div 3 = 8$ 5 units = $5 \times 8 = 40$ There were 40 children in the group.	Example: Three-eighths of the town voted in an election. If 120 of the people voted, how many people lived in the town? Solution: Step 1. Draw the whole divided into eighths:  Step 2. Represent $\frac{3}{8}$: For $\frac{3}{8}$, bracket 3 parts, then bracket the remaining parts.  Step 3. Divide 120 by 3 to find $\frac{1}{8}$ of the people who voted. $120 \div 3 = 40$, which is $\frac{1}{8}$ of the people who voted 

Facts to Remember	Illustration/ Example
	Step 4. Add all the parts to find the whole group: $40 + 40 + 40 + 40 + 40 + 40 + 40 + 40 = 320$ Answer: 320 people lived in the town. Other examples of worded problems are: 1. Kareem said that four fifths of his age is 16 years. How old is Kareem? 2. Charlie bought a book for \$25. He paid $\frac{5}{6}$ of the regular price. What was the regular price of the book?

Facts to Remember	Illustration/ Example
Multiplication of Fractions $\frac{2}{5} \times \frac{1}{3} \quad \text{OR} \quad \frac{2}{5} \text{ of } \frac{1}{3}$  $\frac{2}{5} \times \frac{1}{3} = \frac{2}{15}$ Three-steps to multiply fractions: Step 1. Multiply the numerators Step 2. Multiply the denominators Step 3. Simplify the fraction if needed. OR Reduce the fractions and then multiply numerators and denominators.	Example: $\frac{1}{3} \times \frac{9}{16}$ Step 1. Multiply the numerators: $\frac{1}{3} \times \frac{9}{16} = \frac{1 \times 9}{3 \times 16} = \frac{9}{48}$ Step 2. Multiply the denominators: $\frac{1}{3} \times \frac{9}{16} = \frac{1 \times 9}{3 \times 16} = \frac{9}{48}$ Step 3. Simplify the fraction: $\frac{9 \div 3}{48 \div 3} = \frac{3}{16} \quad (\text{Divide numerator and denominator by 3})$ Example: $\frac{5}{6} \times \frac{2}{3} = \frac{5}{\cancel{6}_3} \times \frac{\cancel{2}^1}{3} = \frac{5 \times 1}{3 \times 3} = \frac{5}{9}$ Example: $\frac{5}{6} \times \frac{9}{10} = \frac{\cancel{5}^1}{\cancel{6}_2} \times \frac{\cancel{9}^3}{\cancel{10}_2} = \frac{1 \times 3}{2 \times 2} = \frac{3}{4}$
Make the whole number a fraction, by putting it over 1. Think of the whole number as being the numerator and 1 as the denominator: Example: $5 = \frac{5}{\textcircled{1}}$	Example: $3 \times \frac{2}{9}$ Solution: Step 1: Put the whole over 1. $\frac{3}{1} \times \frac{2}{9}$ Step 2: Multiply numerators and denominators. $\frac{3 \times 2}{1 \times 9} = \frac{6}{9} = \frac{2}{3}$ Answer: $\frac{2}{3}$

Facts to Remember	Illustration/ Example
Multiplication of Mixed Numbers and Fractions (Model) $\frac{1}{2} \times 1\frac{1}{2} = \frac{3}{4}$ OR $\frac{1}{2}$ of $1\frac{1}{2} = \frac{3}{4}$ 	Example: Multiply $2\frac{1}{4}$ by $\frac{3}{5}$ Solution:  $\frac{3}{5} \times 2\frac{1}{4} = \frac{27}{20}$ (Improper Fraction) OR $= 1\frac{7}{20}$ (Mixed Number) 
Multiplication of Mixed Numbers To multiply mixed numbers, follow these steps: Step 1. Convert to improper fractions Step 2. Multiply the fractions Step 3. Convert the result to mixed numbers	Example: Multiply $1\frac{1}{2}$ by $2\frac{1}{5}$ Step 1. Convert both to improper fractions $1\frac{1}{2} \times 2\frac{1}{5} = \frac{3}{2} \times \frac{11}{5}$ Step 2. Multiply the fractions (multiply the numerators and denominators): $\frac{3}{2} \times \frac{11}{5} = \frac{3 \times 11}{2 \times 5} = \frac{33}{10}$ Step 3. Convert to a mixed number $\frac{33}{10} = 3\frac{3}{10}$ Answer: $3\frac{3}{10}$

Facts to Remember	Illustration/ Example																				
Division of Fractions <table><tr><td colspan="2">$\frac{1}{2}$</td><td colspan="2">$\frac{1}{2}$</td></tr><tr><td>$\frac{1}{4}$</td><td>$\frac{1}{4}$</td><td>$\frac{1}{4}$</td><td>$\frac{1}{4}$</td></tr></table>$\frac{1}{2} \div \frac{1}{4} = 2 \text{ (two } \frac{1}{4} \text{ in one-half)}$$\frac{1}{2} \times \frac{4}{1} = \frac{4}{2} = 2$<table><tr><td colspan="2">$\frac{1}{3}$</td><td colspan="2">$\frac{1}{3}$</td><td colspan="2">$\frac{1}{3}$</td></tr><tr><td>$\frac{1}{6}$</td><td>$\frac{1}{6}$</td><td>$\frac{1}{6}$</td><td>$\frac{1}{6}$</td><td>$\frac{1}{6}$</td><td>$\frac{1}{6}$</td></tr></table>$\frac{2}{3} \div \frac{1}{6} = 4 \text{ (four } \frac{1}{6} \text{ in two-thirds)}$$\frac{2}{3} \times \frac{6}{1} = \frac{12}{3} = 4$ Look at the pattern before we state the rule: Step 1. Turn the divisor (2nd fraction) upside down, i.e. invert. Step 2. Multiply the 1st fraction by the 2nd one. Step 3. Simplify the answer, if needed.	$\frac{1}{2}$		$\frac{1}{2}$		$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{3}$		$\frac{1}{3}$		$\frac{1}{3}$		$\frac{1}{6}$	$\frac{1}{6}$	$\frac{1}{6}$	$\frac{1}{6}$	$\frac{1}{6}$	$\frac{1}{6}$	Example: $\frac{2}{3} \div \frac{4}{5}$ Solution: Step 1. Turn the divisor upside down: $\frac{4}{5} \text{ becomes } \frac{5}{4}$ Step 2. Multiply the 1st fraction by the 2nd one: $\frac{2}{3} \times \frac{5}{4}$ (multiply the numerators and the denominators) $\frac{2}{3} \times \frac{5}{4} = \frac{2 \times 5}{3 \times 4} = \frac{10}{12}$ Step 3. Simplify the fraction: $\frac{10}{12} = \frac{5}{6}$ Answer: $\frac{5}{6}$
$\frac{1}{2}$		$\frac{1}{2}$																			
$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{4}$																		
$\frac{1}{3}$		$\frac{1}{3}$		$\frac{1}{3}$																	
$\frac{1}{6}$	$\frac{1}{6}$	$\frac{1}{6}$	$\frac{1}{6}$	$\frac{1}{6}$	$\frac{1}{6}$																

Facts to Remember	Illustration/ Example
Word problems involving fractions	Example: Martha spent $\frac{4}{9}$ of her allowance on food and shopping. What fraction of her allowance did she have left? Solution: $1 - \frac{4}{9} = \frac{9}{9} - \frac{4}{9} = \frac{5}{9}$ Answer: She had $\frac{5}{9}$ of her allowance left. Example: Sam had 120 teddy bears in his toy store. He sold $\frac{2}{3}$ of them at \$12 each. How much money did he receive? Solution: Step 1. Calculate the number of teddy bears sold. $\frac{2}{3} \times \frac{120}{1} = \frac{2}{\cancel{3}_1} \times \frac{\cancel{120}^{40}}{1} = \frac{80}{1}$ He sold 80 teddy bears. Step 2. Calculate how much money he received. $80 \times 12 = 960$ He received \$960. Answer: Sam received \$960

Facts to Remember	Illustration/ Example
A factor tree breaks down a number into prime numbers. Prime factorisation is expressing a number as a product of its prime factors. Note that the product of the prime factorization is the original number.	Example: Make a factor tree for the number 60 Step 1. Begin by writing down the number 60. Step 2. Below it write down any factor pair whose product is 60. For example, write down 6 and 10 on the branches because $6 \times 10 = 60$. Step 3. <pre> graph TD 60 --- 6 60 --- 10 </pre> Step 4. Next repeat the process with the new branches. Since $2 \times 3 = 6$ and $5 \times 2 = 10$. Write the factors underneath their respective branches. Circle the prime numbers. <pre> graph TD 60 --- 6 60 --- 10 6 --- 2 6 --- 3 10 --- 5 10 --- 2 </pre> Prime Factorization: $2 \times 2 \times 3 \times 5 = 60$

A. NUMBER - Decimals	
Facts to Remember	Illustration/ Example
A decimal number is one which has whole number values and numbers with a fractional value (less than 1). The whole number is separated from the fractional number by a decimal point. The first digit after the decimal point is in the tenths place value. The second digit after the decimal point is in the hundredths place value. The third digit after the decimal point is in the thousandths place value. In consumer arithmetic, the decimal point is also used to separate dollars from cents in money.	As you move to the right in the place value chart, each number place is divided by 10. Example: $1000 \div 10 = 100$ $100 \div 10 = 10$ $10 \div 10 = 1$ This is also true for digits to the right of the decimal point. Example: $1 \div 10 = \frac{1}{10} \text{ or } 0.1 \text{ (one tenth)}$ $\frac{1}{10} \div 10 = \frac{1}{100} \text{ or } 0.01 \text{ (one hundredth)}$ Example:  In the number shown above: There are 5 tenths, having a value of 0.5 or $\frac{5}{10}$ There are 9 hundredths, having a value of 0.09 or $\frac{9}{100}$ Examples: \$1.50 represents one dollar and fifty cents \$5.25 represents five dollars and twenty-five cents \$175.00 represents one hundred and seventy-five dollars

A. NUMBER - Decimals	
Decimal Fractions in Expanded Notation	Example: Express 17.59 using expanded notation. $17.59 = (1 \times 10) + (7 \times 1) + (5 \times \frac{1}{10}) + (9 \times \frac{1}{100})$$= 10 + 7 + 0.5 + 0.09$ 10 7 0.5 0.09 OR T O . th hth 1 0 . 0 0 7 . 0 0 . 5 0 + . 0 9 1 7 . 5 9 Answer: 17.59 = 10 + 7 + 0.5 + 0.09
Comparison of decimals We can use the methods below to compare decimals: Step 1. Set up a table with the decimal point in the same place for each number. Step 2. Put in each number. Step 3. Fill in the empty squares with zeros. Step 4. Compare the numbers using the first column on the left. Step 5. If the digits are equal move to the next column to the right until one digit is larger. OR Step 1. Line up the decimal point. Step 2. Use zeros as place holders Step 3. Visualize the numbers as whole numbers. Step 4. Compare the numbers from smallest to largest.	Example: Put the following decimals in ascending order: 1.5, 1.56, 0.8 Solution: Ones Decimal Point Tenths Hundredths 1 1 0 . . . 5 5 8 0 6 0 Order 2nd 3rd 1st Answer: The ascending order of decimals is 0.8, 1.5, 1.56. Note: To place numbers in ascending order start with the smallest number first. To place numbers in descending order start with the largest number first.

Facts to Remember	Illustration/ Example																																																																						
Addition of decimal fractions To add decimals follow these steps: Step 1. Write the numbers, one under the other, with the decimal values one under the other . Step 2. Use zeros as place holders. Step 3. Then add , remembering to put the decimal point in the answer.	Example: Add 1.45 to 1.3 Step 1. Line up the decimals <table><tr><td></td><td>O</td><td>.</td><td>th</td><td>hth</td></tr><tr><td></td><td>1</td><td>.</td><td>4</td><td>5</td></tr><tr><td>+</td><td>1</td><td>.</td><td>3</td><td></td></tr><tr><td colspan="5"> </td></tr></table> Step 2. Use zeros as place holders <table><tr><td></td><td>O</td><td>.</td><td>th</td><td>hth</td></tr><tr><td></td><td>1</td><td>.</td><td>4</td><td>5</td></tr><tr><td>+</td><td>1</td><td>.</td><td>3</td><td>0</td></tr><tr><td colspan="5"> </td></tr></table> Step 3. Add <table><tr><td></td><td>O</td><td>.</td><td>th</td><td>hth</td></tr><tr><td></td><td>1</td><td>.</td><td>4</td><td>5</td></tr><tr><td>+</td><td>1</td><td>.</td><td>3</td><td>0</td></tr><tr><td colspan="5"> </td></tr><tr><td></td><td>2</td><td>.</td><td>7</td><td>5</td></tr><tr><td colspan="5"> </td></tr></table> Answer: 2.75		O	.	th	hth		1	.	4	5	+	1	.	3								O	.	th	hth		1	.	4	5	+	1	.	3	0							O	.	th	hth		1	.	4	5	+	1	.	3	0							2	.	7	5					
	O	.	th	hth																																																																			
	1	.	4	5																																																																			
+	1	.	3																																																																				
	O	.	th	hth																																																																			
	1	.	4	5																																																																			
+	1	.	3	0																																																																			
	O	.	th	hth																																																																			
	1	.	4	5																																																																			
+	1	.	3	0																																																																			
	2	.	7	5																																																																			
Subtraction of decimal fractions To subtract decimals, follow these steps: Step 1. Write down the numbers, one under the other, with the decimal points one under the other . Step 2. Use zeros as place holders. Step 3. Then subtract , remembering to put the decimal point in the answer.	Example: Subtract 0.03 from 1.1 Step1. Line up the decimals <table><tr><td></td><td>O</td><td>.</td><td>th</td><td>hth</td></tr><tr><td></td><td>1</td><td>.</td><td>1</td><td></td></tr><tr><td>–</td><td>0</td><td>.</td><td>0</td><td>3</td></tr><tr><td colspan="5"> </td></tr></table> Step 2. Use zeros as place holders <table><tr><td></td><td>O</td><td>.</td><td>th</td><td>hth</td></tr><tr><td></td><td>1</td><td>.</td><td>1</td><td>0</td></tr><tr><td>–</td><td>0</td><td>.</td><td>0</td><td>3</td></tr><tr><td colspan="5"> </td></tr></table> Step 3. Subtract <table><tr><td></td><td>O</td><td>.</td><td>th</td><td>hth</td></tr><tr><td></td><td>1</td><td>.</td><td>1</td><td>0</td></tr><tr><td>–</td><td>0</td><td>.</td><td>0</td><td>3</td></tr><tr><td colspan="5"> </td></tr><tr><td></td><td>1</td><td>.</td><td>0</td><td>7</td></tr><tr><td colspan="5"> </td></tr></table> Answer: 1.07		O	.	th	hth		1	.	1		–	0	.	0	3							O	.	th	hth		1	.	1	0	–	0	.	0	3							O	.	th	hth		1	.	1	0	–	0	.	0	3							1	.	0	7

	1	.	1	0																																																																			
–	0	.	0	3																																																																			
	1	.	0	7																																																																			

Facts to Remember	Illustration/ Example
Multiplication of decimal fractions If we look at the answers we see a pattern. We can use the pattern to get a rule for multiplication by decimal fractions. $0.4 \times 3 = 1.2$ $0.23 \times 5 = 1.15$	Example: Tenths multiplied by Whole Numbers 0.4×3 <i>Convert decimal fraction to regular fractions</i> $\frac{4}{10} \times \frac{3}{1} = \frac{12}{10}$ $\frac{12}{10} = 1.2$ $0.4 \times 3 = 1.2$ Example: Hundredths multiplied by Whole Numbers 0.23×5 <i>Convert decimal fraction to regular fractions</i> $\frac{23}{100} \times \frac{5}{1} = \frac{115}{100}$ $\frac{115}{100} = 1\frac{15}{100} = 1.15$ $0.23 \times 5 = 1.15$

Facts to Remember	Illustration/ Example
Division of a decimal number by a whole number Step 1. Put the decimal point in the same spot as the dividend (the number being divided). Step 2. Continue division just as you would with whole numbers.	Example: Divide 9.1 by 7. Put the decimal point in the quotient directly above the decimal point in the dividend. $ \begin{array}{r} 1 \ . \ 3 \\ 7 \overline{) 9 \ . \ 1} \\ \underline{- 7 \ . \ } \\ 2 \ . \ 1 \\ \underline{- 2 \ . \ 1} \\ 0 \end{array} $ Answer: 1.3

Facts to Remember	Illustration/ Example
Division of decimal fractions by powers of 10 When dividing a decimal by: ÷ 10 – shift the decimal point 1 place to the left ÷ 100 – shift the decimal point 2 places to the left	Examples: $3.24 \div 10 = 0.324$
Word problems involving decimal numbers	Example: What is the total length of these three pieces of ribbon: 0.1m, 0.22m, and 0.38m? Solution: $ \begin{array}{r} 0.10\text{ m} \\ 0.22\text{ m} \\ + 0.38\text{ m} \\ \hline 0.70\text{ m} \end{array} $ Answer: The total length is 0.7m Example: A student earns \$11.75 per hour for gardening. If she worked 21 hours this month, then how much did she earn? Solution: To solve this problem, we will multiply \$11.75 by 21. $ \begin{array}{r} \$ 11.75 \quad 2 \text{ decimal places} \\ \times 21 \quad 0 \text{ decimal places} \\ \hline \$ 235.00 \\ \$ 236.75 \quad 2 \text{ decimal places} \end{array} $ Answer: The student earns \$236.75.

Facts to Remember	Illustration/ Example
Express common fractions as decimals (halves, quarters, fifths and tenths) To convert a fraction to a decimal fraction: Step 1. Find an equivalent base ten fraction. Step 2. Express as a decimal fraction	Example: Express $\frac{1}{4}$ to a decimal fraction. Solution 1: $\frac{1}{4} = \frac{1 \times 25}{4 \times 25} = \frac{25}{100} = 0.25$

A. NUMBER - Approximation and Estimation	
Facts to Remember	Illustration/ Example
Approximation produces a useful result to get an estimation of the answer. This is called a rough check or guess estimate. Rough estimates can prevent wrong answers for calculations. Approximating means rounding. You can round up or round down. The symbol $\approx$, means “is approximately equal to”.	The length of a new pencil can be estimated at about 8cm.
Rounding Numbers To round a number use the following steps: Step 1. Identify the digit of the value to which you are approximating. Step 2. Look at the digit to the immediate right, • If it is 5 or more (5, 6, 7, 8, 9) round up by adding 1 to the digit on the left. • If it is less than 5 (4, 3, 2, 1, 0) round down. Step 3. Replace the digits to the right of the rounded value with zeros.	Example: Round 86 to the nearest 10. Solution: Step 1. 8 is the digit in the place value column to which you are rounding. Step 2. 6 is more than 5 so round up by adding 1 to the 8 which is the tens digit, so the tens digit is now 9. Step 3. Replace the ones digit which is 6 with a zero. Answer: $86 \approx 90$, to the nearest 10. Example: Round 143 to the nearest 100. Solution: Step 1. 1 is the digit in the place value column to which you are rounding. Step 2. 4 is less than 5 so round down. Step 3. Replace both the tens digit and the ones digit on the right of the 1 with a zeros. Answer: $143 \approx 100$, to the nearest 100.

Facts to Remember	Illustration/ Example
	Examples: 84 $\approx$ 90, to the nearest 10 45 $\approx$ 50, to the nearest 10 32 $\approx$ 30, to the nearest 10 459 $\approx$ 500, to the nearest 100 398 $\approx$ 400, to the nearest 100 201 $\approx$ 200, to the nearest 100 145 $\approx$ 150 to the nearest 10 145 $\approx$ 100 to the nearest 100 365 $\approx$ 370 to the nearest 10 365 $\approx$ 400 to the nearest 100 726 $\approx$ 730 to the nearest 10 726 $\approx$ 700 to the nearest 100

Facts to Remember	Illustration/ Example
Rounding Decimal Numbers To round a decimal number use the following steps: Step 1. Identify the digit of the value to which you are approximating. Step 2. Look at the digit to the immediate right, • If it is 5 or more (5, 6, 7, 8, 9) round up by adding 1 to the digit on the left. • If is less than 5 (4, 3, 2, 1, 0) round down. Rounding to tenths means there is only one digit after the decimal point.	Example: What is 1.27 rounded to the nearest tenth? Solution: Step 1. Identify the digit in the tenths column: 1. <u>2</u> 7 Step 2. Look at the digit to the immediate right 1. <u>2</u> <u>7</u> The digit “7” at the immediate right is more than 5, so round up by adding 1 to 2: $2 + 1 = 3$. Answer: 1.3 to the nearest tenth.

Facts to Remember	Illustration/ Example
	Example: Ellen wanted to buy a DVD player for \$49.95, a DVD holder for \$19.95 and a pair of earphones for \$21.95. Is \$85.00 enough money for Ellen to buy all three items? Solution: The phrase enough money tells us that we need to estimate the sum of the three items. We will estimate the sum by rounding each amount to the nearest dollar. We must then compare our estimated sum with \$85.00 to see if Ellen has enough money to buy these items. $ \begin{array}{rcl} \$49.95 & \rightarrow & \$50.00 \\ \$19.95 & \rightarrow & \$20.00 \\ + \$21.95 & \rightarrow & + \$22.00 \\ \hline & & \$92.00 \end{array} $ The estimated cost is \$92. Answer: \$85.00 is not enough for Ellen to buy all three items.

A. NUMBER - Percent	
Facts to Remember	Illustration/ Example
Percent means “out of 100”. The symbol % means percent.	Example: 20% means “20 out of 100” or $\frac{20}{100}$ 
To find a percent of a given quantity: Step 1. Express the percent as a fraction Step 2. Multiply the fraction by the quantity Step 3. Simplify	Example: Find 5% of 80. Solution: $\frac{5^1}{100_{51}} \times \frac{80^4}{1} = \frac{4}{1} = 4$ Answer: 4
Conversion of a Percent to a Fraction To convert a percent to a fraction: Step 1. Express the percent as a fraction Step 2. Simplify the fraction (reduce it to its lowest terms)	Example: Convert 12% to a fraction. Solution: $12\% = \frac{12}{100} = \frac{12 \div 4}{100 \div 4} = \frac{3}{25}$ Answer: $\frac{3}{25}$

A. NUMBER - Percent	
Facts to Remember	Illustration/ Example
The whole is 100%. e.g. 25 students in a class 100% of students in the class = 25 e.g. Joy's allowance is \$150.00 100% of Joy's allowance = \$150.00 e.g. Farmer Joe picks 780 oranges 100% of Farmer Joe's oranges = 780	Example: If the whole is 20 then 5 out of 20 is the equivalent of 25%. $\frac{5}{20} \times \frac{100}{1} = \frac{5^1}{20_4} \times \frac{100}{1} = \frac{100}{4} = 25\%$ Example: If the whole is 10 then 2 out of 10 is the equivalent of 20%. $\frac{2}{10} \times \frac{100}{1} = \frac{2^1}{10_5} \times \frac{100}{1} = \frac{100}{5} = 20\%$

Facts to Remember	Illustration/ Example
Conversion of a Decimal to a Percent To convert a decimal fraction to a percent: Step 1. Express the decimal fraction as a fraction. Step 2. Multiply by 100. <i>Remember:</i> <i>Shortcut for multiplying by 100 is shifting the decimal point two places to the right.</i>	Example: Express 0.1 as a percent. Solution: $0.1 \times 100 = \frac{1}{10} \times \frac{100}{1} = \frac{100}{10} = 10\%$ OR $0.1 \times 100 = 10\%$ Answer: 10% Example: Express 0.85 as a percent. Solution: $0.85 \times 100 = \frac{85}{100} = 85\%$
Relate Percent to a Decimal To convert a percent to a decimal: Step 1. Express the percent as a fraction. Step 2. Simplify the fraction (reduce it to its lowest terms). Step 3. Divide the numerator by the denominator.	Example: $10 \% = \frac{10}{100} = \frac{1}{10} = 0.1$ Example: $65\% = \frac{65}{100} = 0.65$

Facts to Remember	Illustration/ Example
Relate Fraction to a Percent To convert from a fraction to a percent: Step 1. Express as an equivalent fraction (out of one hundred) Step 2. Include % symbol. OR Step 1. Convert the fraction to a decimal by dividing the numerator by the denominator Step 2. Then convert the decimal to a percentage by multiplying by 100%. Include % symbol.	Example: Express $\frac{3}{5}$ as a percentage. Solution: $\frac{3}{5} = \frac{3 \times 20}{5 \times 20} = \frac{60}{100} = 60\%$ OR Convert the fraction to a decimal: $\frac{3}{5} = 0.60$ Multiply the decimal by 100: $0.6 \times 100 = 60\%$
Expression of a quantity as a percent of another To express one quantity as a percent of another, • Make sure that both quantities are expressed in the same units. • Write the given quantity as a fraction of the total • Multiply the fraction by 100. • Simplify.	Example: Peter scored 45 marks out of 60 in a test. Express Peter's score as a percent. $\text{Percent of mark} = \frac{45}{60} \times 100 = \frac{45^3}{60_4} \times \frac{100}{1} = \frac{3}{4} \times \frac{100}{1} = 75\%$ Answer: 75%.

Facts to Remember	Illustration/ Example
Word problems involving percent	Example: If 5% of China plays tennis, how many people would you expect to play tennis out of a group of 320 Chinese? Solution: Number of tennis players = 5% of 320 $= 5\% \times 320$ $= \frac{5}{100} \times 320$ $= 16$ Answer: 16 people

B. MEASUREMENT - Money

Facts to Remember

Trinidad and Tobago Currency (not drawn to scale)

Dollar Bills

Coins

Illustration/ Example

Example:

Insert the missing values on the bills and coins required to make **\$20.35**.

Answer:

Bills: \$5, \$5 and Coins: 5¢, 25¢

Insert the missing values on the bills and coins required to make **\$35.71**.

Answer:

Bills: \$20, \$10 and Coins: 1¢, 50¢

Facts to Remember	Illustration/ Example
If an article is sold for more than it cost, then it is said to have been sold at a profit Profit = Selling Price – Cost Price If an article is sold for less than it cost, then it is said to have been sold at a loss. Loss = Cost Price – Selling Price	Example: A store owner bought a shirt for \$10.00 and sold it for \$13.00. a) Calculate the profit made on the sale of the shirt. Solution: a) Profit = Selling price – Cost price $= \$13.00 - \$10.00 = \$3.00$ Answer: The profit is \$3.00 Example: A vase that cost \$60.00 was sold for \$50.00. Find the loss.. Solution: $\begin{aligned} \text{Loss} &= \text{Cost price} - \text{Selling price} \\ &= \$60.00 - \$50.00 = \$10.00 \end{aligned}$ Example: A car was bought for \$60 000.00 and then sold for \$75 000.00. What is the profit? Solution: $\begin{aligned} \text{Profit} &= \text{Selling Price} - \text{Cost Price} \\ &= \$75\,000 - \$60\,000 \\ &= \$15\,000 \end{aligned}$

Facts to Remember	Illustration/ Example
Value Added Tax or V.A.T. is applied to both goods and services in Trinidad and Tobago and is included in the final price of the product. V.A.T. is charged at a rate of 12.5% • $12.5\% = \frac{1}{2}$ of 25% (find 25% and then find half of the amount) OR • 12.5 % = 10 % and 2.5 % ($\frac{1}{4}$ of 10%)	Example: Mr. Ram's bill at a restaurant is \$240.00. V.A.T. of 12.5% is added. How much money must Mr. Ram pay? Solution: $25\% \text{ of } 240 = \frac{25}{100} \times \frac{\$240}{1} = \$60$ $12.5\% = \frac{1}{2} \text{ of } 25\%$ $\frac{1}{2} \text{ of } \$60 = \$30$ V.A.T. = \$30 $\begin{aligned} \text{Total to be paid} &= \text{Amount} + \text{V.A.T.} \\ &= \$240.00 + 30.00 \\ &= \$270.00 \end{aligned}$ Answer: Mr. Ram must pay \$270.00 in total.

Facts to Remember	Illustration/ Example
	Example: The marked price of a dress is \$400.00. Anna paid \$300.00 for the dress. How much discount did she receive? Solution: $\begin{aligned}\text{Discount} &= \text{Marked Price} - \text{Selling Price} \\ &= \$400.00 - \$300.00 \\ &= \$100.00\end{aligned}$ Answer: Anna received a \$100.00 discount. Example: The marked price of a lamp is \$300.00. - If a 20% discount is given, calculate the sale price. - If the V.A.T. is charged at 12.5%, calculate the amount of V.A.T. paid on the discounted price. - Calculate the cost of the lamp. Solution: $\text{a) } 20\% \text{ of } \$300.00 = \frac{20}{100} \times \frac{\$300}{1} = \$60.00$ $\begin{aligned}\text{Sale price} &= \text{Marked Price} - \text{Discount} \\ &= \$300.00 - \$60.00 = \$240.00\end{aligned}$ Answer: The sale price is \$240.00 b) Hint: To calculate V.A.T. use $12.5\% = \frac{1}{2}$ of 25% Price after discount is \$240.00 $\begin{aligned}\text{V.A.T.} &= 12.5\% \text{ of } \$240.00 \\ &= \frac{1}{2} \times \$60 \text{ (25\% of } \$240) \\ &= \$30\end{aligned}$ Answer: V.A.T. worth \$30.00 was paid on the

Facts to Remember	Illustration/ Example
	discounted price. c) V.A.T. inclusive price = \$240.00 + V.A.T. = \$240.00 + \$30.00 = \$270.00 Answer: The total cost of the lamp is \$270.00.

Facts to Remember	Illustration/ Example																																																					
Important Terms related to Wages: Fortnightly means 2 weeks or 14 days A wage is the money received for work that is done daily, weekly or fortnightly. A salary is money received for work done monthly or yearly. Rate of pay is the amount being paid for the time spent at work. An hourly rate is the amount of money paid for an hour spent at work. A daily rate is the amount of money paid for a day spent at work. Overtime means extra hours worked at a given rate.	Example: Mr. Khan works for 5 days a week from 8:00 a.m. to 3:00 p.m. He is paid a rate of \$80.00 per hour. a) Calculate his daily wage. b) Calculate his weekly wage. Solution: <table><tr><td>a)</td><td>No. of hours worked</td><td>=</td><td>7 hours</td></tr><tr><td></td><td>Hourly rate</td><td>=</td><td>\$80.00</td></tr><tr><td></td><td>Daily Wage</td><td>=</td><td>\$80.00 × 7</td></tr><tr><td></td><td></td><td>=</td><td>\$560.00</td></tr></table> Answer: His daily wage is \$560.00 <table><tr><td>b)</td><td>No. of days worked per week</td><td>=</td><td>5 days</td></tr><tr><td></td><td>Daily wage</td><td>=</td><td>\$560.00</td></tr><tr><td></td><td>Weekly Wage</td><td>=</td><td>\$560.00× 5</td></tr><tr><td></td><td></td><td>=</td><td>\$2 800.00</td></tr></table> Answer: His weekly wage is \$2 800.00 Example: Fred earns \$20.00 per hour for a regular 8 hour day. He worked for 12 hours on Monday. Calculate his total wage for Monday if he is paid at a rate of \$30.00 per hour for the extra hours of work. Solution: <table><tr><td>No. of regular hours</td><td>=</td><td>8hrs</td></tr><tr><td>Hourly rate</td><td>=</td><td>\$20.00</td></tr><tr><td>Pay for regular hours</td><td>=</td><td>\$20.00 × 8 = \$160.00</td></tr><tr><td>Overtime hours</td><td>=</td><td>12 hrs – 8 hrs = 4 hrs</td></tr><tr><td>Pay for overtime hours</td><td>=</td><td>\$30.00 × 4 = \$120.00</td></tr><tr><td>Total wage for Monday</td><td>=</td><td>\$160.00 + \$120.00</td></tr><tr><td></td><td>=</td><td>\$280.00</td></tr></table> Answer: His total wage for Monday is \$280.00	a)	No. of hours worked	=	7 hours		Hourly rate	=	\$80.00		Daily Wage	=	\$80.00 × 7			=	\$560.00	b)	No. of days worked per week	=	5 days		Daily wage	=	\$560.00		Weekly Wage	=	\$560.00× 5			=	\$2 800.00	No. of regular hours	=	8hrs	Hourly rate	=	\$20.00	Pay for regular hours	=	\$20.00 × 8 = \$160.00	Overtime hours	=	12 hrs – 8 hrs = 4 hrs	Pay for overtime hours	=	\$30.00 × 4 = \$120.00	Total wage for Monday	=	\$160.00 + \$120.00		=	\$280.00
a)	No. of hours worked	=	7 hours																																																			
	Hourly rate	=	\$80.00																																																			
	Daily Wage	=	\$80.00 × 7																																																			
		=	\$560.00																																																			
b)	No. of days worked per week	=	5 days																																																			
	Daily wage	=	\$560.00																																																			
	Weekly Wage	=	\$560.00× 5																																																			
		=	\$2 800.00																																																			
No. of regular hours	=	8hrs																																																				
Hourly rate	=	\$20.00																																																				
Pay for regular hours	=	\$20.00 × 8 = \$160.00																																																				
Overtime hours	=	12 hrs – 8 hrs = 4 hrs																																																				
Pay for overtime hours	=	\$30.00 × 4 = \$120.00																																																				
Total wage for Monday	=	\$160.00 + \$120.00																																																				
	=	\$280.00																																																				

Facts to Remember	Illustration/ Example
Calculation of Simple Interest Money deposited in a bank will earn interest at the end of the year. Principal (P): Money deposited or borrowed. Time (T): Period for which money is borrowed or invested. It is calculated using years. Rate (R): This is the amount you pay for borrowing. It is stated as a percentage. Simple Interest (SI): The money earned or the money paid on a loan. If interest is always calculated on the original principal, it is called simple interest. To calculate Simple Interest use the formula: $\text{SI} = \text{Principal} \times \text{Rate} \times \text{Time}$ OR $\text{SI} = P \times R \times T$ When Rate is expressed as a percentage the formula is often seen as: $\text{SI} = \frac{P \times R \times T}{100}$ Amount: The total of the Principal and the Simple Interest To calculate the Amount use the formula: $\text{Amount} = \text{Principal} + \text{Simple Interest}$	Example: Calculate the simple interest on \$460.00, at 5% per annum for 3 years. $\begin{aligned} \text{Simple interest} &= \frac{P \times R \times T}{100} \\ &= \frac{\$460.00 \times 5 \times 3}{100} \\ &= \$69.00 \end{aligned}$ Example: Simon wanted to borrow \$1 800.00 to buy new tyres for his car. He was told he could take a loan for 30 months at 10% simple interest per year. - Calculate how much interest the bank will charge. - Calculate the Amount he will need to pay the bank. Solution: a) $P = \\$1\,800.00$ $R = 10\%$ $T = \frac{30}{12} = 2.5$ years $\text{SI} = \frac{P \times R \times T}{100} = \frac{\$1\,800.00 \times 10 \times 2.5}{100} = \450.00 Answer: The bank will charge \$450.00 in interest. b) Amount = Principal + Simple Interest $\begin{aligned} &= \$1\,800.00 + \$450.00 \\ &= \$2\,250.00 \end{aligned}$ Answer: He will need to repay \$2 250.00 to the bank.

Facts to Remember	Illustration/ Example
Comparing Unit Prices can be a good way of finding which choice is the “best buy”.	Example: Which are cheaper, 10 pencils for \$4.00 or 6 pencils for \$2.70? Solution: Find the Unit Cost: • $\\$4.00 \div 10 = \\0.40 per pencil • $\\$2.70 \div 6 = \\0.45 per pencil The lower Unit Cost is the better bargain. Answer: 10 pencils for \$4.00 are cheaper.

B. MEASUREMENT - Linear Measure	
Facts to Remember	Illustration/ Example
The standard unit for measuring length is the metre. Other units which are used for measuring length are, • millimetre • centimetre • kilometre We can measure how long things are, or how tall, or how far apart they are by using these measures.	A centimetre (cm) is approximately: • the length of a staple • the width of a fingernail • the width of 5 CD's stacked on top of each other • the thickness of a notepad. • the radius (half the diameter) of a one cent coin A metre (m) is approximately: • the width of a doorway • the height of a countertop • five steps up a staircase • the depth of the shallow end of a swimming pool • the width of a dining table • the height of a 5 year old • shoulder to opposite wrist of an adult • outstretched arms of a child • waist high on an adult • one long step of an adult male. A kilometre (km) is approximately: • $2\frac{1}{2}$ laps around an athletic track • The distance walked in 12 minutes
A non-standard unit is a unit of measure expressed in terms of an object. Non-standard units can be objects such as a shoe, a toothpick, a paper clip or a hand span.	Example: What is the length of the pencil?  Answer: The length of the pencil is 5 paper clips long.
Conversion Table of Metric measurements for Length	10 millimetres (mm) = 1 centimetre (cm) 100 centimetres = 1 metre (m) 1 000 metres = 1 Kilometre (Km) 

Facts to Remember	Illustration/ Example																					
Two lengths can be compared	Example: How much longer is the line AB than the line CD?  A B C D Solution: Length of AB = 6 cm Length of CD = 2 cm 6 cm – 2 cm = 4 cm Answer: AB is 4 cm longer than CD.																					
Read and record linear measures using decimal notation.	Example: Four points a, b, c and d are illustrated below on a ruler:  Record of Distances <table><tr><th>Distance</th><th>Measure in Millimetres</th><th>Measure in Centimetres</th></tr><tr><td>a to b</td><td>15 mm</td><td>1.5 cm</td></tr><tr><td>a to c</td><td>23 mm</td><td>2.3 cm</td></tr><tr><td>a to d</td><td>32 mm</td><td>3.2 cm</td></tr><tr><td>b to c</td><td>8 mm</td><td>0.8 cm</td></tr><tr><td>b to d</td><td>17 mm</td><td>1.7 cm</td></tr><tr><td>c to d</td><td>9 mm</td><td>0.9 cm</td></tr></table>	Distance	Measure in Millimetres	Measure in Centimetres	a to b	15 mm	1.5 cm	a to c	23 mm	2.3 cm	a to d	32 mm	3.2 cm	b to c	8 mm	0.8 cm	b to d	17 mm	1.7 cm	c to d	9 mm	0.9 cm
Distance	Measure in Millimetres	Measure in Centimetres																				
a to b	15 mm	1.5 cm																				
a to c	23 mm	2.3 cm																				
a to d	32 mm	3.2 cm																				
b to c	8 mm	0.8 cm																				
b to d	17 mm	1.7 cm																				
c to d	9 mm	0.9 cm																				

Facts to Remember	Illustration/ Example
Solve problems involving addition and subtraction of measures in (a) metres and centimetres (b) kilometres and metres	Example: In the Summer Olympic Games, athletes compete in races of the following lengths: 100 meters, 200 meters, 400 meters, 800 meters, 1500 meters, 5000 meters and 10,000 meters. If a runner were to run in all these races, how many kilometers would he run? $ \begin{array}{r} 10,000 \\ 5,000 \\ 1,500 \\ 800 \\ 400 \\ 200 \\ + 100 \\ \hline 18,000 \end{array} $ To figure out how many kilometers he would run, you need to first add all of the lengths of the races together and <i>then</i> convert that measurement to kilometers. 1000m = 1km 18000 m = $\frac{18\,000}{1\,000}$ km = 18 km The runner would run 18 kilometers.
Subtraction of metric measures Sometimes it is necessary to convert all values to the same unit before attempting to subtract. Align place values then subtract as required.	Example: The length of a rope is 80 m. If a piece of 35 m 40 cm length is cut, what length of the rope is left? Solution: Total length of the rope = 80m Piece cut from the rope = 35m 40cm $ \begin{array}{r} \text{m} \quad \text{cm} \\ 79 \\ \cancel{80} \quad ^1 00 \quad \text{Regrouping is required: 1m = 100cm} \\ - 35 \quad 40 \\ \hline 44 \quad 60 \end{array} $ Hence, the length of the rope left = 44m 60c m.

Facts to Remember	Illustration/ Example
Solving problems involving measures in metres and millimetres	Example: Coach Kelly brought 32 litres of water to the football game, and she divided the water equally among 8 coolers. How much water would each cooler contain, in millimetres? Solution: 1L = 1 000 ml 32L = $32 \times 1\,000\text{ mL} = 32\,000\text{ mL}$ $\frac{32\,000\text{ mL}}{8} = 4\,000\text{ mL}$ Answer: Each cooler contains 4 000 millilitres of water.

B. MEASUREMENT - Perimeter	
Facts to Remember	Illustration/ Example
Perimeter is the distance around a two-dimensional shape. In other words, perimeter is the distance around any flat or plane shape. A polygon is a shape enclosed by three or more straight sides. To find the perimeter of a polygon, calculate the sum of all the lengths of its sides.	
Square  The perimeter of a square is calculated using the formula, $S + S + S + S$ OR $S \times 4$ where S is the length of each side.	Example:  length of side = 4cm Perimeter of square $= 4\text{cm} + 4\text{cm} + 4\text{cm} + 4\text{cm}$ $= 16 \text{ cm}$ Example: A square has a side of length 5 cm. Find the perimeter of the square.  length of side = 5cm Perimeter of Square $= 5\text{cm} \times 4$ $= 20 \text{ cm}$

Facts to Remember	Illustration/ Example
Rectangle  The perimeter of a rectangle is calculated using the formula, $L + L + W + W$ OR $2L + 2W$ (opposite sides are equal) where L is the length of the rectangle and W is the width of the rectangle.	Example:  Perimeter of rectangle $= 7\text{cm} + 3\text{cm} + 7\text{cm} + 3\text{cm}$ $= 20\text{cm}$
Trapezium  The perimeter of a trapezium is calculated using the formula, Perimeter $= \text{length of side } a + \text{length of side } b$ $+ \text{length of side } c + \text{length of side } d$ OR Sum of the lengths of all four sides	Example: Find the perimeter of the trapezium below.  Perimeter of trapezium $= 10 + 8 + 4.3 + 4.1$ $= 26.4 \text{ cm}$

Facts to Remember	Illustration/ Example
Parallelogram  The perimeter of a parallelogram is calculated using the formula, $a + b + a + b$ OR $2(a + b)$	Example:  Perimeter of parallelogram $= 12\text{cm} + 7\text{cm} + 12\text{cm} + 7\text{cm}$ $= 38\text{cm}$

Facts to Remember	Illustration/ Example
Solving problems involving perimeter (finding unknown sides)	Example: The perimeter of the triangle is 26 cm (not drawn to scale). What is the length of the missing side?  Solution: Total length of known sides = 15cm + 8cm = 23 cm Length of missing side: S = 26cm – 23cm = 3cm Answer: The length of the missing side is 3cm. Example: The perimeter of the square is 6 cm (not drawn to scale). What is the length of each side of the square?  Solution: Perimeter = S + S + S + S = 4 × S = 6cm $S = \frac{6}{4} = 1.5\text{cm}$ Answer: Length of each side of the square is 1.5cm Example: The perimeter of the rectangle is 36cm and its length is 12cm. Calculate the width of the rectangle.  Solution: Perimeter = W + 12cm + W + 12cm = 36cm $2W + 24\text{cm} = 36\text{cm}$$2W = 36\text{cm} - 24\text{cm} = 12\text{cm}$$W = \frac{12\text{cm}}{2} = 6\text{cm}$ Answer: The width of the rectangle is 6cm.

Facts to Remember	Illustration/ Example
Solve problems involving perimeter of polygons	Example: Example: The hexagon has a perimeter of 36cm. What is the length of one side of the hexagon if all sides are equal?  Solution: $\text{Perimeter} = S + S + S + S + S + S = 36\text{cm}$ $6S = 36\text{cm}$ $S = \frac{36\text{cm}}{6} = 6\text{cm}$ Answer: The length of one side of the hexagon is 6cm.

B. MEASUREMENT - Area	
Facts to Remember	Illustration/ Example
Area and its units The area of a shape is the total number of square units that fill the shape. The unit of measure for area is the square metre: $1\text{m} \times 1\text{m} = 1\text{m}^2$ The square centimetre, $1\text{cm} \times 1\text{cm} = 1\text{cm}^2$, is also used as a unit to measure smaller areas.  (not drawn to scale)	Example: A square metre is about: • half the area of a doorway • the area of a door is approximately 2 m^2 (approximately $2\text{m} \times 1\text{m}$). Example: The size of a dollar bill is approximately 112cm^2 (approximately $16\text{cm} \times 7\text{cm}$).
Square  Area of Square = $S \times S = S^2$	Example: A square has a side of length 5 cm. Find the area of the square.  length of side = 5cm Area of Square = $5\text{cm} \times 5\text{cm} = 25\text{ cm}^2$ Answer: Area of Square is 25 cm^2
Rectangle  L represents the length of the rectangle B represents the width of the rectangle Area of Rectangle = $L \times B$	Example: A rectangle has a length of 9 cm and a width of 4cm. Find the area of the rectangle.  $L = 9\text{cm}$ and $B = 4\text{cm}$ Area of Rectangle = $9\text{cm} \times 4\text{cm}$ = 36 cm^2 Answer: Area of rectangles is 36 cm^2

Facts to Remember	Illustration/ Example
	Example: The floor of a room shown below has to be covered with 12 cm square tiles. How many tiles will be needed to cover the entire area of the floor?  12m 6m Solution: Area of the floor = $L \times B = 12\text{m} \times 6\text{m} = 72\text{ m}^2$ $1\text{ m}^2 = 10\,000\text{ cm}^2$ So $72\text{m}^2 = 72 \times 10\,000\text{ cm}^2 = 720\,000\text{cm}^2$ Area of 1 square tile = $12 \times 12\text{ cm}^2 = 144\text{ cm}^2$ No. of tiles needed to cover floor = $\frac{720\,000}{144} = 5000\text{ tiles}$ OR Computation can be done as follows: $\frac{1200 \times 600}{12 \times 12} = 100 \times 50 = 5000\text{ tiles}$

B. MEASUREMENT - Volume

Facts to Remember

Calculate volume by counting cubes

We can calculate the volume of objects/shapes by counting cubes.

This cuboid has 4 layers of 6 cubes.

It has a volume of 24 cubes.

If these cubes are 1cm cubes then the volume of the cuboid is 24 cm^3 .

Illustration/ Example

Examples:

Volume of cuboid:
4 layers of 15 cubes
 $= 4 \times 15$ cubes
 $= 60$ cubes

The volume of this shape can be calculated like this:

layer 1: 1 cube

layer 2: $2 + 1 = 3$ cubes

layer 3: $3 + 2 + 1 = 6$ cubes

layer 4: $4 + 3 + 2 + 1 = 10$ cubes

Volume of shape
 $= 10$ cubes $+ 6$ cubes $+ 3$ cubes $+ 1$ cubes
 $= 20$ cubes

Calculate the volume of the shape below:

layer 1: $1 \times 4 = 4$ cubes
layer 2: $2 \times 4 = 8$ cubes
layer 3: $3 \times 4 = 12$ cubes
layer 4: $5 \times 4 = 20$ cubes

Volume of shape = 44 cubes

Another method of counting:

11 rows of 4 cubes = 44 cubes

Other suitable methods of counting cubes can be used.

Facts to Remember	Illustration/ Example
Volume is the amount of space that an object occupies. It is measured in cubic units. Volume has three dimensions.	
Cube  Volume of cube = $s \times s \times s = s^3$	Example: Find the volume of a cube with a side of length 10cm.  Solution: Volume of cube = $10\text{cm} \times 10\text{cm} \times 10\text{cm}$ $= 1\,000\text{cm}^3$ Answer: Volume is $1\,000\text{cm}^3$
Cuboid  Volume of cuboid = length $\times$ breadth $\times$ height $= l \times b \times h$	Example: Find the volume of a cuboid with length 10cm, breadth 2cm and height 3cm.  Solution: Volume of cuboid = length $\times$ breadth $\times$ height $= 10\text{cm} \times 2\text{cm} \times 3\text{cm}$ $= 60\text{cm}^3$ Answer: Volume is 60cm^3

Facts to Remember	Illustration/ Example
Capacity is the amount that something can hold. The units of capacity are litres (L or l) and millilitres (mL or ml).	Example: The pack below holds $\frac{1}{4}$ litre of milk. Mummy bought 6 of these packs. What is the total volume of milk in cm^3 that Mummy got from the 6 packs? Solution: Volume of one $\frac{1}{4}$ litre pack = $1\,000\text{cm}^3 \div 4 = 250\text{cm}^3$ Volume of six $\frac{1}{4}$ litre packs = $250\text{cm}^3 \times 6 = 1\,500\text{cm}^3$ OR Six $\frac{1}{4}$ litre packs = $6 \times \frac{1}{4}$ litres $= \frac{6}{1} \times \frac{1}{4} = \frac{6}{4} = 1.5 \text{ litres}$ Recall, 1 L = 1000 cm^3 Therefore, 1.5 L = $1.5 \times 1\,000\text{ cm}^3 = 1\,500\text{ cm}^3$ Answer: Total volume of milk is 1500 cm^3 Example: The aquarium below has length 50cm, breadth 20cm and height 30cm. What is the capacity of the aquarium in litres?

Facts to Remember	Illustration/ Example
	Solution: Step 1: Find the volume of the aquarium. $= L \times B \times H$ $= 50\text{cm} \times 20\text{cm} \times 30\text{cm} = 30\,000\text{ cm}^3$ Step 2: Convert cm^3 to litres. Recall, $1\text{ L} = 1000\text{ cm}^3$ $6\,000\text{ cm}^3 = \frac{6\,000}{1\,000}\text{ L} = 6\text{ L}$ Answer: The capacity of the aquarium is 6 L. Example: A drinking glass holds 250ml of water. How many glasses of water are needed to fill a mug having a capacity of 2 litres? Solution: Recall, $1\,000\text{ mL} = 1\text{ L}$ Capacity of mug in millilitres: $2\text{ L} = 2 \times 1\,000\text{ mL} = 2\,000\text{ mL}$ No. of glasses needed to fill the mug = $\frac{2\,000\text{ mL}}{250\text{ mL}} = 8$ Answer: 8 glasses of water are needed to fill a mug.

B. MEASUREMENT - Mass	
Facts to Remember	Illustration/ Example
The mass of an object refers to how heavy an object can be because of the amount of matter it contains. The standard unit of mass in the metric system is the kilogram (kg). The gram (g) is the unit used for measuring very small objects. 1 kilogram = 1 000 grams e.g. A dictionary has a mass of approximately one kilogram. e.g. A paperclip weighs about one gram.	Example: What is the weight of the sack of flour in kilograms?  Solution: 1 kg = 1 000 g The sack of flour weighs 650 g $650 \text{ g} = \frac{650}{1000} = 0.65 \text{ kg}$ (Recall: To divide by 1000, move the decimal point 3 places to the left) Answer: The weight of the sack of flour is 0.65 kg Example: What is the difference in grams between the masses of the packs of sugar and flour shown below?  Solution: Recall, 1 kg = 1 000g Mass of sugar = 1.7 kg = 1 700 g Mass of flour = 1 690 g $\text{Mass of sugar} - \text{mass of flour} = 1\,700\text{g} - 1\,690\text{g} = 10 \text{ g}$ Answer: 10 g

B. MEASUREMENT - Time													
Facts to Remember	Illustration/ Example												
We can convert units of time: 60 seconds = 1 minute 60 minutes = 1 hour 24 hours = 1 day 7 days = 1 week 52 weeks = 1 year Time is measured using a clock or a watch. a.m. refers to morning. p.m. refers to afternoon, evening and night.	Example: Sam watched a movie that was 150 minutes long. State the length of the movie in hours. Solution: 1 hour = 60 minutes $150 \text{ minutes} = \frac{150}{60} = 2 \frac{1}{2} \text{ hours}$ Answer: The movie was $2 \frac{1}{2}$ hours long.												
A clock or watch is called analog when the time is indicated by the positions of rotating hands on the face, and hours marked from 1 to 12. If it has three moving hands, then we can tell the hours, the minutes, and the seconds. If it has two moving hands, then we can tell the hours and the minutes but not the seconds. 	Example: Ria and her family arrived at the mall in the afternoon at the time shown on the clock below. They spent $1\frac{3}{4}$ hours at the mall. What time did Ria and her family leave the mall? 												
	Solution: Time shown on the clock is 4:15. $1\frac{3}{4}$ hours later can be calculated as follows: 1 hour later is 5:15 $\frac{3}{4}$ hour later is 5:15 + 45 minutes = 6:00 OR Computation can be done as follows: <table><tr><td>hr</td><td>min</td><td></td></tr><tr><td>4</td><td>: 15</td><td></td></tr><tr><td>1</td><td>: 45</td><td>+</td></tr><tr><td>6</td><td>: 00</td><td>(15mins + 45mins = 60 mins = 1 hour)</td></tr></table> Answer: Ria and her family left the mall at 6 p.m.	hr	min		4	: 15		1	: 45	+	6	: 00	(15mins + 45mins = 60 mins = 1 hour)
hr	min												
4	: 15												
1	: 45	+											
6	: 00	(15mins + 45mins = 60 mins = 1 hour)											

Facts to Remember	Illustration/ Example
A digital clock displays the time in numerals where the hours, minutes, and sometimes seconds are indicated by digits. 	Example: Write the time shown on the clock in digital notation.  Answer: 3:40 Example: Write the time shown on the clock in digital notation.  Answer: 8:00:06

C. GEOMETRY – Angles (Turns) and Lines	
Facts to Remember	Illustration/ Example
An angle is the amount of turn between two straight lines at a fixed point (the vertex).	
A turn means to rotate about a point. A turn is also called a rotation. A complete turn measures 360° $\frac{1}{4}$ turn measures 90° $\frac{1}{2}$ turn measures 180° $\frac{3}{4}$ turn measures 270° When you turn an object, - the position changes - the image is the same size as the object - the image is the same shape as the object - the orientation of the object and its image is the same. In a complete turn the object and its image are in the same position	Example 

Types of angles

Less than quarter turn

Right Angle

Quarter turn

Greater than quarter turn

Half Turn

Greater than half turn

Whole Turn

Facts to Remember	Illustration/ Example
A straight line is the shortest distance between two points.	A  B
Parallel lines are always the same distance apart and will never meet or intersect.	Example: 
Perpendicular lines are at right angles (90°) to each other.	Example:  Example: 

C. GEOMETRY - Plane Shapes**Facts to Remember****Types of Triangles:**

A triangle is a three-sided plane shape.

A plane or flat shape has two dimensions.

Name	Shape	Properties
Scalene Triangle		No two sides are equal; No two angles are equal
Isosceles Triangle		Two equal sides; Two equal angles
Equilateral Triangle		Three equal sides; Three equal 60° angles
Right-angled Triangle		A line is perpendicular to another if it meets or crosses it at right angles (90°). A right angled triangle has one 90° angle (right angle). The little square in the corner tells us it is a right-angled triangle.

Facts to Remember**Types of Quadrilaterals:**

A quadrilateral is a four-sided plane shape.

A plane or flat shape has two dimensions.

Name	Shape	Properties
Square		All sides are equal; Opposite sides are equal and parallel; All angles are equal; All angles are right angles (90°)
Rectangle		Opposite sides are equal and parallel; Four equal angles; All angles are right angles (90°)
Parallelogram		Opposite sides are equal Opposite sides are parallel
Rhombus		All sides are equal; Opposite sides are parallel;
Kite		Two pairs of equal sides
Trapezium		One pair of opposite sides are parallel

C. GEOMETRY - Solids	
Facts to Remember	Illustration/ Example
A solid has three dimensions. A face is any of the flat or curved surfaces of a solid. An edge is where two faces meet. All solids have one or more edges and faces. A vertex is a point where three or more edges meet. The plural of vertex is vertices. A solid may have no vertex, one vertex or more than one vertex.	Examples:  The first diagram shows a cube with labels: 'Vertex' pointing to a corner, 'Edge' pointing to a side, and 'Face' pointing to the front face. The second diagram shows a rectangular prism with labels: 'Face' pointing to the top face, 'Edge' pointing to the front bottom edge, and 'Vertex' pointing to the bottom right corner. The third diagram shows a triangular prism with labels: 'Vertex' pointing to the top corner, 'Face' pointing to the right side face, and 'Face (also a base)' pointing to the left triangular face. The fourth diagram shows a square pyramid with labels: 'vertex' pointing to the top point, 'face' pointing to one of the triangular sides, and 'edge' pointing to the bottom front edge.

Facts to Remember				
Types of Solids				
Name	Shape	No. of Edges	No. of Faces	No. of Vertices
Cube		12	6	8
Cuboid		12	6	8
Cylinder		2	3	0
Sphere		0	1	0
Cone		1	2	1 Apex
Triangular Prism		9	5	6
Triangular-based Pyramid		6	4	4
Square-based Pyramid		8	5	5

C. GEOMETRY - Symmetry	
Facts to Remember	Illustration/ Example
- A line of symmetry is any line along which a shape can be folded so that one half fits exactly onto the other half (no overlapping). - The line of symmetry is also called the 'mirror line'; it can be horizontal, vertical or at any angle. - Some shapes have no lines of symmetry. - A circle has an infinite number of lines of symmetry.	Examples:  A square has 4 lines of symmetry  A rhombus has 2 lines of symmetry  A kite has 1 line of symmetry  A rectangle has 2 lines of symmetry  An equilateral triangle has 3 lines of symmetry Non-examples_  The scalene triangle does not possess any lines of symmetry.  The parallelogram does not possess any lines of symmetry.

D. STATISTICS

Facts to Remember

The **Mean** is that quantity which represents an even spread for a set of values.

Mean of the numbers 3, 8 and 4 is 5.

Mean of the numbers 6, 11 and 7 is 8.

Mean of the numbers 4, 8, 6 and 18 is 9.

To calculate the **mean**:

- **Add** all the numbers.
- **Divide by how many** numbers that were added.

The **Mode** refers to the value or item that is most popular or the one which occurs most frequently in a set of data.

Illustration/ Example

Example:

The table below shows Adam's cricket scores for five days in a week.

Calculate his mean score for that week.

Days of the Week	Cricket Scores
Monday	9
Tuesday	11
Wednesday	17
Thursday	28
Friday	15

Solution:

$$\text{Mean score} = \frac{9 + 11 + 17 + 28 + 15}{5} = \frac{80}{5} = 16$$

Answer: Adam's mean score for that week is 15.

Example:

The mean of 20 and 10 is the same as the mean of 16 and another number.

What is the other number?

Solution:

$$\text{Mean of 20 and 10} = \frac{20+10}{2} = \frac{30}{2} = 15$$

If the mean of 16 and another number is 15, then the total of these two numbers is $15 \times 2 = 30$.

Since 16 is one of the numbers, the other number is $30 - 16 = 14$

Answer: The other number is 14.

Example:

Find the mode, for the following shirt sizes:
13, 18, 13, 14, 13, 16, 14, 21, 13

Answer: The modal shirt size is 13.

Facts to Remember	Illustration/ Example										
Tally Chart	Example: The scores awarded for a test given to a Standard 5 class of 12 students were as follows: 6, 7, 5, 7, 7, 8, 7, 6, 7, 6, 8, 7 a) Construct a tally chart for the scores. b) Calculate the mean. c) Find the mode. Solution: a) Step 1: Construct a table with three columns. The first column shows what is being tallied. Step 2. The 1st score is 6, so put a tally mark against 6 in the 2nd column. The 2nd score is 7, so put a tally mark against 7 in the 2nd column. The 3rd score is 5, so put a tally mark against 5 in the 3rd column. Continue to tally all scores. Remember, every 5th tally mark is drawn across the previous 4 tally marks. Step 3: Count the number of tally marks for each score and write it in third column. Answer: Tally of Scores awarded to Students <table border="1" data-bbox="987 1365 1338 1600"> <thead> <tr> <th>Score</th><th>Tally</th></tr> </thead> <tbody> <tr> <td>5</td><td> </td></tr> <tr> <td>6</td><td> </td></tr> <tr> <td>7</td><td> </td></tr> <tr> <td>8</td><td> </td></tr> </tbody> </table> b) Mean = $\frac{6+7+5+7+7+8+7+6+7+6+8+7}{12}$ $= \frac{81}{12} = 6.75$ Answer: The mean score is 6.75. c) Answer: Mode or Modal Score is 7.	Score	Tally	5		6		7		8	
Score	Tally

Facts to Remember	Illustration/ Example																		
A Pictograph is a way of representing data using pictures. Each picture represents a certain number of items.	Example: The pictograph below represents the number of smarties in a pack: <table border="1" data-bbox="803 415 1523 976"> <thead> <tr> <th>Colour</th><th>Number of Smarties</th></tr> </thead> <tbody> <tr> <td>Green</td><td></td></tr> <tr> <td>Orange</td><td></td></tr> <tr> <td>Blue</td><td></td></tr> <tr> <td>Pink</td><td></td></tr> <tr> <td>Yellow</td><td></td></tr> <tr> <td>Red</td><td></td></tr> <tr> <td>Purple</td><td></td></tr> <tr> <td>Brown</td><td></td></tr> </tbody> </table> Key  = 2 smarties  = 1 smartie a) How many red smarties were in the pack? b) What was the modal colour? c) Which coloured smarties were equal in number? d) What was the total number of smarties in the pack? e) What fraction of the total number of smarties was pink? Solution: a) If  represent s 2 smarties Then  represents $2 \times 4 = 8$ smarties Answer: 8 red smarties were in the pack b) Yellow smarties occurred the most. Answer: Yellow is the modal colour	Colour	Number of Smarties	Green		Orange		Blue		Pink		Yellow		Red		Purple		Brown	
Colour	Number of Smarties																		
Green																			
Orange																			
Blue																			
Pink																			
Yellow																			
Red																			
Purple																			
Brown																			

Facts to Remember	Illustration/ Example
	c) There were 7 green smarties, 7 orange smarties and 7 purple smarties. Answer: The green, orange and purple coloured smarties were equal in number. d)  Answer: The total number was 54 smarties (e) No. of pink smarties = 6 Total no. of smarties = 54 $\frac{\text{No. of pink smarties}}{\text{Total no. of smarties}} = \frac{6}{54} = \frac{1}{9}$ Answer: $\frac{1}{9}$ of the total number of smarties were pink

Facts to Remember	Illustration/ Example												
A Bar Graph is a graphical display of data using bars of different heights or lengths.	Example: The incomplete bar graph below shows the pets owned by 32 students in a Standard 5 class. <table border="1"> <caption>Pets Owned</caption> <thead> <tr> <th>Pets</th> <th>No. of Pets</th> </tr> </thead> <tbody> <tr> <td>Rabbit</td> <td>4</td> </tr> <tr> <td>Dog</td> <td>8</td> </tr> <tr> <td>Cat</td> <td>10</td> </tr> <tr> <td>Goldfish</td> <td>0</td> </tr> <tr> <td>Hamster</td> <td>5</td> </tr> </tbody> </table> a) How many more students own cats than rabbits? b) What percent of the class owns dogs? c) How many students own hamsters? d) Complete the graph by drawing the bar to represent the number of students who own goldfish. Solution: a) No. of students who own cats = 10 No. of students who own rabbits = 4 No. who own cats – No. who own rabbits = 10 – 4 = 6 Answer: 6 more students own cats than rabbits b) No. of students who own dogs = 8 Total no. of students in the class = 32 Percent of the class who owns dogs = $\frac{8}{32} \times \frac{100}{1} = 25\%$ Answer: 25% of the class owns dogs.	Pets	No. of Pets	Rabbit	4	Dog	8	Cat	10	Goldfish	0	Hamster	5
Pets	No. of Pets												
Rabbit	4												
Dog	8												
Cat	10												
Goldfish	0												
Hamster	5												

Facts to Remember	Illustration/ Example												
	c) Answer: 5 students own hamsters d) Answer: <table border="1"> <caption>Pets Owned</caption> <thead> <tr> <th>Pets</th> <th>No. of Pets</th> </tr> </thead> <tbody> <tr> <td>Rabbit</td> <td>4</td> </tr> <tr> <td>Dog</td> <td>8</td> </tr> <tr> <td>Cat</td> <td>10</td> </tr> <tr> <td>Goldfish</td> <td>6</td> </tr> <tr> <td>Hamster</td> <td>5</td> </tr> </tbody> </table>	Pets	No. of Pets	Rabbit	4	Dog	8	Cat	10	Goldfish	6	Hamster	5
Pets	No. of Pets												
Rabbit	4												
Dog	8												
Cat	10												
Goldfish	6												
Hamster	5

Equivalent Fractions

$$\frac{1}{2} = \frac{2}{4} = \frac{4}{8} = \frac{5}{10} = \frac{50}{100}$$

$$\frac{1}{4} = \frac{2}{8} = \frac{25}{100}$$

$$\frac{1}{5} = \frac{2}{10} = \frac{20}{100}$$

$$\frac{2}{5} = \frac{4}{10} = \frac{40}{100}$$

$$\frac{3}{5} = \frac{6}{10} = \frac{60}{100}$$

$$\frac{4}{5} = \frac{8}{10} = \frac{80}{100}$$

Problem Solving involving Money

Cost Price: Price the retailer pays for an item

Selling Price: Price at which the retailer sells an item

A **profit** is gained when an article is sold for *more* than what it cost

Profit = Selling Price – Cost Price

A **loss** is made when an article is sold for *less* than what it cost.

Loss = Cost Price – Selling Price

Profit and loss are often expressed as percentages of the cost price. They are often called **gain or profit percent** or **loss percent**.

A **Discount** is the difference between the Marked Price and the Selling Price. It is a reduction in the Marked Price.

Value Added Tax or **V.A.T.** is tax on goods and services. It is included in the total cost.

V.A.T. is charged at a rate of 12.5% of the value of the goods or services.

Plane Shapes and Measures

TRIANGLE

Perimeter: $\text{Side} + \text{Side} + \text{Side}$

Side: $\text{Perimeter} - (\text{Side} + \text{Side})$

SQUARE

Perimeter: $\text{Side} \times 4$

Side: $\text{Perimeter} \div 4$

Area: $\text{Side} \times \text{Side}$

Side: $\sqrt{\text{Area}}$

RECTANGLE

Perimeter: $(L + B) \times 2$ OR $2L + 2B$

Area: $L \times B$

Length: $A \div B$

Breadth: $A \div L$

Solids and Measures

CUBE

Volume:	$S \times S \times S$	OR	S^3
Side:	$\sqrt[3]{\text{Volume}}$		
Surface Area:	$S \times S \times 6$	OR	Area of Face $\times 6$

CUBOID

Volume:	$L \times B \times H$
---------	-----------------------

Metric System

Quantity	Unit of measure	Other Units of measure	Conversion of Units
Length	metre (m)	millimetre (mm) centimetre (cm) kilometre (km)	10 millimetres = 1 centimetre 100 centimetres = 1 metre 1000 metres = 1 kilometre
Mass	gram (g)	kilogram (kg)	1 kilogram = 1000 grams
Area	square metres (m²)	square centimetres (cm ²) square kilometres (km ²)	1 square metre = 10 000 square centimetres 1 m ² = 100 cm x 100 cm = 10 000 cm ²
Volume	cubic metres (m³) <i>(for solids and liquids)</i>	cubic centimetre (cm ³)	1 litre = 1000 millilitres 1 millilitre = 1 cm ³ 1 000 ml = 1 000 cm ³
	litre (l or L) <i>(for liquids)</i>	millilitre (ml or mL)	
Time	hour (hr)	minute (min), second (s)	1 hour = 60 minutes 1 minute = 60 seconds

Strategy for Solving Problems

Step 1: Understand the Problem

- ✗ Read the problem carefully.
- ✗ Identify what information you are given (known) and what you are asked to find or show (unknown).
- ✗ Can you restate the problem in your own words?
- ✗ Draw a picture or diagram to help you understand the problem.
- ✗ Is this problem similar to another problem you have solved?

Step 2: Devise A Plan

- ✗ Can one of the problem solving strategies you know be used?
 - ✗ Often a considerable amount of creativity is required to develop a plan.
- | | |
|---------------------------|--------------------------------|
| • Look for a Pattern | • Make an Organized List/Table |
| • Draw a Picture/Diagram | • Act It Out |
| • Use Objects | • Work Backwards |
| • Solve a Simpler Problem | • Use a Number Sentence |
| • Guess and Check | • Use Logical Reasoning |

Step 3: Carry Out The Plan

- ✗ Implement your chosen strategy/strategies until the problem is solved.
- ✗ Check each step in your solution as you implement it.
- ✗ Can you see clearly if each step is correct?
- ✗ Can you prove it?
- ✗ Don't be afraid to start over, modify, or change your plan.
- ✗ Give yourself a reasonable length of time to solve the problem.

Step 4: Look Back

- ✗ Carefully examine the solution obtained.
- ✗ Is your answer reasonable?
- ✗ Can you check the results in the reverse order?
- ✗ Have you checked that all the relevant information was used?
- ✗ Are the appropriate units of measure stated?

INCLUDE

When one value is smaller than another
we use a "less than" sign $<$

When one value is bigger than another
we use a "greater than" sign $>$

Example:

Compare 3 and 8

$$3 < 8 \text{ or } 8 > 3$$

Page 85, change 32 to 33 students in the Bar Graph

Pg 81 Adam mean score is 16

Pg 19 Remove () behind Radius
