

Introduction:

Disposal of garbage is very important in all communities. Solid waste can be biological and domestic, it can be disposed of by putting it in a dump or landfill. If the garbage is burnt the smoke pollutes the air. In the dumps many flies and other pests are often found there. Garbage can be divided into different categories:

- 1.** Biodegradable- able to be broken down by microorganisms
- 2.** Non-biodegradable- not able to be broken down by microorganisms

Industrial waste comes from factories and might pollute the rivers and air surrounding them.
