

## Preventing Rusting

### **1. Painting**

The paint provides a waterproof layer to the metal preventing the entry of air and water.

### **2. Oil or Greasing**

The oil coating keeps out water and oxygen. Imported motor vehicles are usually covered with grease to protect it from sea spray.

### **3. Electroplating**

Coating the metal with a non-corrosive metal by the process of electrolysis.

### **4. Galvanizing**

Steel is covered with a layer of zinc. Zinc forms a protective covering for the steel.
